(54) **DRUG DISCHARGE PUMP INHIBITORS**

(57) A medicament for preventive and/or therapeutic treatment of a microbial infection having an activity of eliminating resistance of a microorganism with acquired resistance to an antimicrobial agent, which comprises as an active ingredient a compound represented by the following general formula (I), a physiologically acceptable salt thereof, or a hydrate thereof:

EP 1 227 084 A1

wherein  $R^1$  and  $R^2$  independently represent hydrogen atom, a halogen atom, carboxyl group and the like;  $J^1$  represents a 5- or 6-membered heteroaromatic ring;  $W^1$  represents  $-\text{CH}=\text{CH}-$ ,  $-\text{C}=\text{C}-$ ,  $-\text{CH}_2\text{CH}_2-$  and the like;  $A^1$  represents phenylene group, pyridinediyl group, furandiyl group and the like;  $G^1$  represents oxygen atom, carbonyl group, ethynyl group and the like;  $p$  represents an integer of from 0 to 3;  $G^2$  represents phenylene group, furandiyl group, tetrahydrofurandiyl group and the like;  $G^3$  represents  $-\text{CH}_2-$  or single bond;  $m$  and  $n$  represent an integer of 0 or 1; and  $Q^1$  represents an acidic group.

## Description

## Technical Field

- 5 [0001] The present invention relates to a medicament useful for preventive and therapeutic treatment of microbial infectious diseases.

## Background Art

- 10 [0002] For preventive or therapeutic treatment of infectious diseases caused by microorganisms, various antibacterial agents have so far been developed, and drugs such as  $\beta$ -lactam antibiotics (penicillins, cepheems, monobactams, carbapenems, and penems), aminoglycosides, quinolones, macrolides, tetracyclines, rifamycins, chloramphenicols, and phosphomycins have been practically used. However, with the increase of clinically used amount of antibacterial agents, remarkable numbers of resistant bacterial strains to these antibacterial agents have emerged, which becomes  
15 a serious problem in the treatment of infectious diseases.

- [0003] Examples of problematic bacteria, which cause particularly intractable or serious infectious diseases among those caused by resistant bacteria, include *Pseudomonas aeruginosa* and methicillin-resistant *Staphylococcus aureus* (MRSA). Antibacterial agents effective against these bacteria have been limited so far, and it is not certain whether or not therapeutic efficacy of the currently available drugs will be expected in the future. In particular, no drug is available  
20 at present by which specifically high efficacy against resistant *Pseudomonas aeruginosa* can be achieved. With the increase of aged population and the popularization of sophisticated medical technologies including human organ transplantation and anti-cancer treatments, infections frequently occurring particularly in patients with reduced immunity, i. e., so-called opportunistic infections, have become an extremely serious problem in the clinical field, and under the circumstances, early developments of measures against the resistant bacteria are desired.

- 25 [0004] Recently, the presence of drug efflux pumps has recognized as a bacterial excretion mechanism of drugs through researches on resistance acquiring mechanisms of resistant bacteria. In earlier researches, a pump that specifically excretes a tetracycline antibacterial agent from bacterial cells was identified in 1980 by the group of Levy, and the discovery was noted as a major factor of the resistance to tetracycline (L. McMurry, Proc. Natl. Acad. Sci. U.S.A., 77, 3974, 1980). Furthermore, based on recent researches, the presence of multidrug-excreting drug efflux pumps  
30 was reported in *Escherichia coli*, *Pseudomonas aeruginosa*, *Bacillus subtilis*, *Staphylococcus bacteria*, *Diplococcus pneumoniae*, and *Neisseria gonorrhoeae*. Four multidrug efflux pumps have so far been reported as homological drug efflux pumps deriving from *Pseudomonas aeruginosa*, and they have been considered as a cause of low drug sensitivity inherent to *Pseudomonas aeruginosa* (K. Poole et al., J. Bacteriol., 175, 7363, 1993; K. Poole et al., M. Microbiol., 21, 713, 1996; T. Kohler et al., M. Microbiol., 23, 345, 1997; T. Mine et al., Antimicrob. Agents Chemother., 43, 415, 1999).

- 35 [0005] The drug efflux pumps of *Pseudomonas aeruginosa* excrete various drugs including  $\beta$ -lactams, tetracyclines, chloramphenicols, and quinolones, to which the drug resistance of *Pseudomonas aeruginosa* is attributable.

- [0006] In order to overcome the problem, it will be effective to develop an antibacterial agent that has a novel structure, by which resistance acquisition due to a drug efflux pump, one of factors of resistance acquisition, can be avoided, or develop an agent for a combinational use with currently available antibacterial agents that can restore their efficacy  
40 by inhibiting functions of drug efflux pumps.

- [0007] In recent years, the rational drug design has been recognized as an important approach in the drug design. The method can be divided mainly into two categories. One is a method applied when three dimensional information of a target protein or the like has been revealed, by which novel compounds are designed on the basis of the data. If a crystal structure is revealed in a ligand-bound state, designs will be made easier. The other method is applied when  
45 the coordinates of a target have not been revealed. In this case, a method is adopted wherein a modeling is carried out on the basis of structure-activity correlation between a compound having an activity and derivatives thereof as well as their three dimensional structures, and results are utilized for a novel design.

- [0008] Examples of typical techniques for the latter method include, for example, methods using the following programs and the like: CATALYST™ (Greene et al., J. Chem. Inf. Comp. Sci., 1994, 34, 1297-1308), DISCO (Martin Y. C., et al., J. Comp. Aided Mol. Design, 1993, 7, 83-102), COMFA (Cramer R. D., J. Am. Chem. Soc., 1988, 110, 5959-5967). By using these programs and by imputing and analyzing the information of the correlation between structures and activities as well as information of the structures, three dimensional coordinates (pharmacophore) that indicate conditions required for expression of the activity can be obtained. Use of accurate pharmacophore improves  
50 accuracy of the design, and highly contributes to efficient creation of effective medicaments. In addition, activity of a compound can be expected by using the resulting pharmacophore. Recently, such approaches have been intensively made. For example, International Publication WO98/04913 discloses the backgrounds and the like, and examples for reduction to practice as well as examples of practical applications.

## Disclosure of the Invention

[0009] Therefore, an object of the present invention is to provide a novel medicament for the treatment of infectious diseases that improves therapeutic efficacy of an agent against pathogenic microorganisms, in particular, a medicament that acts on a microorganism with acquired resistance to an antimicrobial agent, and eliminates the resistance of the bacteria by inhibiting a drug efflux pump so as to improve preventive and/or therapeutic effect of the antimicrobial agent.

[0010] The inventors of the present invention conducted various researches to achieve the foregoing object. Namely, they selected compounds having resistant-eliminating effect from novel and known classes of compounds by applying criteria relating to improvement of the eliminating action on the resistant to antimicrobial agents using *Pseudomonas aeruginosa* having acquired resistance, and prepared derivatives thereof and investigated their activities. Moreover, they succeeded in constructing a pharmacophore indicated by specific coordinates by using techniques which involve conformational analysis of the derivatives and analysis of correlation between the conformations and activities. As a result, they found that the compounds that fit the pharmacophore had an inhibitory activity on drug efflux pumps of *Pseudomonas aeruginosa*. The present invention was achieved on the basis of these findings.

[0011] The present invention thus provides a medicament for preventive and/or therapeutic treatment of microbial infections, which comprises as an active ingredient a compound represented by the following general formula (I), a physiologically acceptable salt thereof, or hydrates thereof, wherein:

R<sup>1</sup> and R<sup>2</sup> independently represent hydrogen atom, a halogen atom, carboxyl group, an alkoxycarbonyl group, an amino group which may be substituted, an alkyl group which may be substituted, an aryl group which may be substituted, or a heterocyclic group which may be substituted, or R<sup>1</sup> and R<sup>2</sup> may bind to each other to represent a saturated or unsaturated 5- to 7-membered ring formed together with two adjacent ring-membered atoms of J<sup>1</sup> to which R<sup>1</sup> and R<sup>2</sup> bind;

R<sup>3</sup> represents hydrogen atom, hydroxyl group, or an alkoxy group;

J<sup>1</sup> represents a 5- or 6-membered heteroaromatic ring;

W<sup>1</sup> represents a group selected from the group consisting of -CH=CH-, -C≡C-, -CH<sub>2</sub>CH<sub>2</sub>-, -OCH<sub>2</sub>-, -SCH<sub>2</sub>-, -OCH<sub>2</sub>O-, -CH<sub>2</sub>O-, -CH<sub>2</sub>-, -CO-, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-, -CH<sub>2</sub>NH-, -NHCH<sub>2</sub>-, -CH<sub>2</sub>S-, -CONH-, -CH<sub>2</sub>SCH<sub>2</sub>-, -CH=CH-CONH- and -CH<sub>2</sub>OCH<sub>2</sub>- (each group binds at its left end to a ring-membered atom of J<sup>1</sup>) or single bond;

A<sup>1</sup> represents a phenylene group which may be substituted, a pyridinediyl group which may be substituted, a furandiyl group which may be substituted, a thiophenediyl group which may be substituted, a benzofurandiyl group which may be substituted, a benzo[b]thiophenediyl group which may be substituted, a benzoxazolediyl group which may be substituted, a benzothiazolediyl group which may be substituted, a pyrido[1,2-a]pyrimidinediyl group which may be substituted, a quinazolinediyl group which may be substituted, a benzotriazinediyl group which may be substituted, a 2H-chromenediyl group which may be substituted, a quinolin-4-one-diyl group which may be substituted, an azaquinolin-4-one-diyl group which may be substituted, a quinolinediyl group which may be substituted, a thiadiazolo[3,2-a]pyrimidinediyl group which may be substituted, or a thiazolo[3,2-a]pyrimidinediyl group which may be substituted;

G<sup>1</sup> represents oxygen atom, carbonyl group, ethynyl group, -CH=N-, -N(R<sup>4</sup>)-CO-, -(CH<sub>2</sub>)-N(R<sup>5</sup>)-CO-, -N(R<sup>6</sup>)-, -N(R<sup>7</sup>)-SO<sub>2</sub>-, -SO<sub>2</sub>-N(R<sup>8</sup>)-, -CON(R<sup>9</sup>)-, -C(=CHR<sup>10</sup>)-, -C(R<sup>11</sup>)=C(R<sup>12</sup>)-, -NHCO-C(R<sup>13</sup>)(R<sup>14</sup>)-, -CONH-C(R<sup>15</sup>)(R<sup>16</sup>)- or -CH<sub>2</sub>O(CH<sub>2</sub>)<sub>q</sub>- wherein R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sup>8</sup> and R<sup>9</sup> independently represent hydrogen atom, hydroxyl group or an alkyl group which may be substituted; R<sup>10</sup> represents cyano group, carboxyl group or an alkoxycarbonyl group which may be substituted; R<sup>11</sup> and R<sup>12</sup> independently represents hydrogen atom, a halogen atom, an alkyl group which may be substituted, or an aryl group which may be substituted, or R<sup>11</sup> and R<sup>12</sup> represent a ring formed by binding to each other; R<sup>13</sup> and R<sup>14</sup> independently represent hydrogen atom or an alkyl group, or R<sup>13</sup> and R<sup>14</sup> represent an alkylene group formed by binding to each other;

R<sup>15</sup> and R<sup>16</sup> independently represent hydrogen atom or an alkyl group, or R<sup>15</sup> and R<sup>16</sup> represent an alkylene group formed by binding to each other; and q represents an integer of from 0 to 5;

p represents an integer of from 0 to 3;

G<sup>2</sup> represents a phenylene group which may be substituted, a furandiyl group which may be substituted, a tetrahydrofurandiyl group which may be substituted, a pyridinediyl group which may be substituted, a thiazolinediyl group which may be substituted, an isoxazolidinediyl group which may be substituted, a 1,3-dioxolanediyl group

which may be substituted, a thiophenediyl group which may be substituted, a pyrimidinediyl group which may be substituted,  $-C(R^{17})=C(R^{18})-[C(R^{19})=C(R^{20})]_y-$  wherein  $R^{17}$ ,  $R^{18}$ ,  $R^{19}$  and  $R^{20}$  independently represent hydrogen atom, a halogen atom, an alkyl group which may be substituted, or an aryl group which may be substituted, or represent a ring formed by  $R^{17}$  and  $R^{18}$  bound to each other, and/or a ring formed by  $R^{19}$  and  $R^{20}$  bound to each other, and  $y$  represents an integer of from 0 to 3, or  $-C(R^{21})(R^{22})-C(R^{23})(R^{24})-$  wherein  $R^{21}$ ,  $R^{22}$ ,  $R^{23}$  and  $R^{24}$  independently represent hydrogen atom, phenyl group, or an alkyl group having 1 to 6 carbon atoms, or represent a ring formed by  $R^{21}$  and  $R^{22}$  bound to each other and/or a ring formed by  $R^{23}$  and  $R^{24}$  bound to each other, or alternatively, represent a ring formed by  $R^{21}$  and  $R^{23}$  bound to each other;

$G^3$  represents  $-CH_2-$  or single bond;

$m$  and  $n$  independently represent an integer of 0 or 1; and

$Q^1$  represents an acidic group.

[0012] As other aspects of the present invention, provided are a medicament for eliminating resistance of a microorganism with acquired drug resistance, which comprises a compound represented by the aforementioned general formula (I), a physiologically acceptable salt thereof, or a hydrate thereof as an active ingredient; and a medicament for enhancing effect of an antimicrobial agent, which comprises a compound represented by the aforementioned general formula (I), a physiologically acceptable salt thereof, or hydrates thereof as an active ingredient. The aforementioned medicaments wherein the microorganism is *Pseudomonas aeruginosa* are preferred embodiments of the present invention. The present invention also provides a pharmaceutical composition for preventive and/or therapeutic treatment of microbial infections, which comprises a compound represented by the aforementioned general formula (I), a physiologically acceptable salt thereof, or a hydrate thereof together with an antimicrobial agent.

[0013] As further aspects of the present invention, provided are a method for preventive and/or therapeutic treatment of microbial infections, which comprises the step of administering to a mammal including human a preventively and/or therapeutically effective amount of a compound represented by the aforementioned general formula (I), a physiologically acceptable salt thereof, or a hydrate thereof; a method for eliminating resistance of a microorganism with acquired resistance to an antimicrobial agent, which comprises the step of contacting with the microorganism an effective amount of a compound represented by the aforementioned general formula (I), a physiologically acceptable salt thereof, or a hydrate thereof; a method for inhibiting acquisition of resistance to an antimicrobial agent by a microorganism, which comprises the step of contacting with a microorganism an effective amount of a compound represented by the aforementioned general formula (I), a physiologically acceptable salt thereof, or a hydrate thereof; a method for enhancing sensitivity of a microorganism to an antimicrobial agent, which comprises the step of contacting with a microorganism an effective amount of a compound represented by the aforementioned general formula (I), a physiologically acceptable salt thereof, or a hydrate thereof; and a method for improving effect of an antimicrobial agent, which comprises the step of administering to a mammal including human an effective amount of a compound represented by the aforementioned general formula (I), a physiologically acceptable salt thereof, or a hydrate thereof. The compounds represented by the aforementioned general formula (I), physiologically acceptable salts thereof, or hydrates thereof are usually administered with one or more of antimicrobial agents simultaneously or separately, or successively. The present invention also provides a use of the compounds represented by the aforementioned general formula (I), physiologically acceptable salts thereof, or hydrates thereof for the manufacture of the aforementioned medicaments.

[0014] In addition to the aforementioned inventions, the present invention also provides a compound represented by the following general formula (II) or a salt thereof, and a medicament which comprises a compound represented by the following general formula (II), a physiologically acceptable salt thereof, or hydrates thereof as an active ingredient:

wherein,  $R^{31}$  and  $R^{32}$  independently represent hydrogen atom, a halogen atom, carboxyl group, an alkoxy carbonyl group, an amino group which may be substituted, an alkyl group which may be substituted, an aryl group which may be substituted, or a heterocyclic group which may be substituted, or  $R^{31}$  and  $R^{32}$  represent a 6-membered ring formed by  $R^{31}$  and  $R^{32}$  bound to each other together with two adjacent ring-membered atoms of  $J^{11}$ ;

$J^{11}$  represents a 5- or 6-membered heteroaromatic ring;

$W^{11}$  represents a group selected from the group consisting of  $-CH=CH-$ ,  $-CH_2CH_2-$ ,  $-OCH_2-$ ,  $-SCH_2-$ ,  $-OCH_2O-$ ,

-CH<sub>2</sub>O-, -CH<sub>2</sub>-, -CO-, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-, -CH<sub>2</sub>NH-, -NHCH<sub>2</sub>-, -CH<sub>2</sub>S-, -CONH-, -CH<sub>2</sub>SCH<sub>2</sub>-, -CH=CH-CONH- and -CH<sub>2</sub>OCH<sub>2</sub>- (each group binds at its left end to a ring-membered atom of J<sup>11</sup>) or single bond;

A<sup>11</sup> represents a pyridinediyl group which may be substituted, a pyrido[1,2-a]pyrimidinediyl group which may be substituted, a quinolin-4-one-diyl group which may be substituted, an azaquinolin-4-one-diyl group which may be substituted, a quinolinediyl group which may be substituted, a thiadiazolo[3,2-a]pyrimidinediyl group which may be substituted, or a thiazolo[3,2-a]pyrimidinediyl group which may be substituted;

G<sup>11</sup> represents oxygen atom, carbonyl group, ethynyl group, -CH=N-, -N(R<sup>33</sup>)CO-, -N(R<sup>34</sup>)-SO<sub>2</sub>-, -SO<sub>2</sub>-N(R<sup>35</sup>)-, -CO-N(R<sup>36</sup>)-, -C(=CHR<sup>37</sup>)- or -C(R<sup>38</sup>)-C(R<sup>39</sup>)- wherein R<sup>33</sup>, R<sup>34</sup>, R<sup>35</sup>, R<sup>36</sup>, R<sup>37</sup>, R<sup>38</sup> and R<sup>39</sup> independently represent hydrogen atom or an alkyl group which may be substituted;

m represents an integer of 0 or 1; and

Q<sup>11</sup> represents an acidic group.

[0015] Moreover, the present invention provides a compound which has a partial structure occupying the following four sites in the following tolerance, and has an action for inhibiting drug efflux pumps of *Pseudomonas aeruginosa*; a salt thereof; or a hydrate thereof.

Site	Feature	x(Å)	y(Å)	z(Å)	Tolerance (Å)
1	Hydrophobic	8.839	-0.324	1.49	2
2	Hydrophobic	4.819	1.836	-0.29	1.7
3	Hydrophobic	-1.722	-0.964	0.89	1.7
4	Negative Ionizable	-8.636	-1.067	-2.554	2

[0016] According to a preferred embodiment of this invention, the aforementioned compound, the salt thereof, or the hydrates thereof have an inhibitory activity on drug efflux pump of *Pseudomonas aeruginosa* (MPC4: the inhibitory activity against drug efflux pump of *Pseudomonas aeruginosa* means a minimum concentration of a medicament required to reduce a minimum inhibitory concentration of an antibacterial agent against the bacterium to a quarter.) of about 40 µg/mL or less, preferably 10 µg/mL or less, further preferably 1 µg/mL or less.

[0017] As another aspect of the present invention, provided is a drug efflux pump inhibitor which comprises the aforementioned compound, a physiologically acceptable salt thereof, or a hydrate thereof. The present invention also provides a method for screening a compound having an inhibitory activity against drug efflux pump of *Pseudomonas aeruginosa* which comprises the step of determining whether or not a partial structure of a test compound occupies the aforementioned four sites in the aforementioned tolerance by means of a computer program and/or an experimental three dimensional structure analysis.

[0018] The present invention further provides a drug efflux pump inhibitor of *Pseudomonas aeruginosa* which comprises a compound obtained by the aforementioned screening. As for the compound screened as mentioned above, it is preferred to verify that an inhibitory activity thereof against drug efflux pumps of *Pseudomonas aeruginosa* (MPC4) is 40 µg/mL or less, preferably 10 µg/mL or less, further preferably 1 µg/mL or less.

[0019] Examples of the compound which has a partial structure occupying the aforementioned four sites in the aforementioned tolerance and has an inhibitory action against drug efflux pumps of *Pseudomonas aeruginosa* or a salt thereof, include the compound of the aforementioned general formula (I) or (II) or salts thereof.

#### Best Mode for Carrying out the Invention

[0029] The terms used in the present specification have the following meanings. An alkyl group or an alkyl moiety of a substituent containing the alkyl moiety (e.g., an alkoxy group) may be linear, branched, cyclic, or a combination thereof unless otherwise specifically mentioned. The alkyl groups have 1 to 8 carbon atoms, preferably about 1 to 6 carbon atoms unless otherwise specifically mentioned, which may be represented by the term "lower". More specifically, examples of the alkyl groups include methyl group, ethyl group, n-propyl group, isopropyl group, cyclopropyl group, n-butyl group, isobutyl group, sec-butyl group, tert-butyl group, cyclobutyl group, cyclopropylmethyl group, n-pentyl group, isopentyl group, neopentyl group, cyclopentyl group, 1,1-dimethylpropyl group, n-hexyl group, isohexyl group, cyclohexyl group, n-heptyl group, n-octyl group and the like. When the term "halogen atom" is referred to, any of fluorine atom, chlorine atom, bromine atom, and iodine atom may be used.

[0030] Examples of the aryl group include those having 5 to 14 carbon atoms, preferably those having 5 to 10 carbon atoms (e.g., benzene ring, naphthalene ring). The aryl ring may be either a monocyclic ring or a condensed ring.

[0031] As the heterocyclic group, a residue of a hetero ring may be used which has 1 to 4 hetero atoms selected from oxygen atom, sulfur atom and nitrogen atom, and 3 to 10 ring-membered atoms in total. Examples of the hetero ring that constitutes the heterocyclic group include, for example, furan ring, dihydrofuran ring, tetrahydrofuran ring, pyrane ring, dihydropyran ring, tetrahydropyran ring, benzofuran ring, isobenzofuran ring, chromene ring, chroman ring, isochroman ring, thiophene ring, benzothiophene ring, pyrrole ring, pyrroline ring, pyrrolidine ring, imidazole ring, imidazoline ring, imidazolidine ring, pyrazole ring, pyrazoline ring, pyrazolidine ring, triazole ring, tetrazole ring, pyridine ring, pyridine oxide ring, piperidine ring, pyrazine ring, piperazine ring, pyrimidine ring, pyridazine ring, indolizine ring, indole ring, indoline ring, isoindole ring, isoindoline ring, indazole ring, benzimidazole ring, purine ring, quinolidine ring, quinoline ring, phthalazine ring, naphthylidine ring, quinoxaline ring, quinazoline ring, cinnoline ring, pteridine ring, oxazole ring, oxazolidine ring, isoxazole ring, isoxazolidine ring, thiazole ring, benzothiazole ring, thiazylidine ring, isothiazole ring, isothiazolidine ring, dioxane ring, dithian ring, morpholine ring, thiomorpholine ring, phthalimide ring and the like.

[0032] In the specification, when a functional group is defined as "which may be substituted", the definition means that the functional group may have one or more substituents. The number of substituents, as well as types and substitution positions thereof are not particularly limited, and when two or more substituents exist, they may be the same or different. Examples of the substituent include, for example, an alkyl group; an alkenyl group (preferably those having 2 to 8 carbon atoms, more preferably 2 to 6 carbon atoms, and most preferably 2 to 5 carbon atoms, for example, vinyl group, allyl group, 2-butenyl group, 3-pentenyl group and the like), an alkynyl group (preferably those having 2 to 8 carbon atoms, more preferably 2 to 6 carbon atoms, and most preferably 2 to 5 carbon atoms, for example, propargyl group, 3-pentynyl group and the like), an aryl group (preferably those having 6 to 14 carbon atoms, more preferably 6 to 12 carbon atoms, and most preferably 6 to 10 carbon atoms, for example, phenyl group, naphthyl group and the like), an aralkyl group (preferably those having 7 to 15 carbon atoms, more preferably 7 to 13 carbon atoms, further preferably 7 to 11, and most preferably 7 to 9 carbon atoms, for example, benzyl group,  $\alpha$ -methylbenzyl group, 2-phenylethyl group, naphthylmethyl group and the like), amino group, a substituted amino group (preferably those having 0 to 16 carbon atoms, more preferably 0 to 12 carbon atoms, and most preferably 0 to 8 carbon atoms, for example, methylamino group, dimethylamino group, diethylamino group, dibenzylamino group and the like), an alkoxy group (preferably those having 1 to 8 carbon atoms, more preferably 1 to 6 carbon atoms, and most preferably 1 to 4 carbon atoms, for example, methoxy group, ethoxy group, butoxy group and the like), an aryloxy group (preferably those having 6 to 14 carbon atoms, more preferably 6 to 12 carbon atoms, and most preferably 6 to 10 carbon atoms, for example, phenyloxy group, 2-naphthyloxy group and the like), an acyl group (preferably those having 1 to 14 carbon atoms, more preferably 1 to 12 carbon atoms, and most preferably 1 to 10 carbon atoms, for example, acetyl group, benzoyl group, formyl group, pivaloyl group and the like), an alkoxycarbonyl group (preferably those having 2 to 9 carbon atoms, more preferably 2 to 7 carbon atoms, and most preferably 2 to 5 carbon atoms, for example, methoxycarbonyl group, ethoxycarbonyl group and the like), an aryloxy carbonyl group (preferably those having 7 to 15 carbon atoms, more preferably 7 to 13 carbon atoms, and most preferably 7 to 11 carbon atoms, for example, phenyloxycarbonyl group and the like), an acyloxy group (preferably those having 2 to 15 carbon atoms, more preferably 2 to 13 carbon atoms, and most preferably 2 to 11 carbon atoms, for example, acetoxyl group, benzoyloxy group and the like),

an acylamino group (preferably those having 2 to 15 carbon atoms, more preferably 2 to 13 carbon atoms, and most preferably 2 to 11 carbon atoms, for example, acetylamino group, benzoylamino group and the like), an alkoxycarbonylamino group (preferably those having 2 to 9 carbon atoms, more preferably 2 to 7 carbon atoms, and most preferably 2 to 5 carbon atoms, for example, methoxycarbonylamino group and the like), an aryloxycarbonylamino group (preferably those having 7 to 15 carbon atoms, more preferably 7 to 13 carbon atoms, and most preferably 7 to 11 carbon atoms, for example, phenyloxycarbonylamino group and the like), a sulfonylamino group (preferably those having 1 to 14 carbon atoms, more preferably 1 to 12 carbon atoms, and most preferably 1 to 10 carbon atoms, for example, methanesulfonylamino group, benzenesulfonylamino group and the like), a sulfamoyl group (preferably those having 0 to 14 carbon atoms, more preferably 0 to 12 carbon atoms, and most preferably 0 to 10 carbon atoms, for example, sulfamoyl group, methylsulfamoyl group, dimethylsulfamoyl group, phenylsulfamoyl group and the like), a carbamoyl group (preferably those having 1 to 14 carbon atoms, more preferably 1 to 12 carbon atoms, and most preferably 1 to 10 carbon atoms, for example, carbamoyl group, methylcarbamoyl group, diethylcarbamoyl group, phenylcarbamoyl group and the like), an alkylthio group (preferably those having 1 to 8 carbon atoms, more preferably 1-6 carbon atoms, and most preferably 1 to 4 carbon atoms, for example, methylthio group, ethylthio group and the like), an arylthio group (preferably those having 6 to 14 carbon atoms, more preferably 6 to 12 carbon atoms, and most preferably 6 to 10 carbon atoms, for example, phenylthio group and the like), a sulfonyl group (preferably those having 1 to 14 carbon atoms, more preferably 1 to 12 carbon atoms, and most preferably 1 to 10 carbon atoms, for example, mesyl group, tosyl group and the like), a sulfinyl group (preferably those having 1 to 14 carbon atoms, more preferably 1 to 12 carbon atoms, and most preferably 1-10 carbon atoms, for example, methanesulfinyl group, benzenesulfinyl group and the like), a ureido group (one having preferably 1-14 carbon atoms, more preferably 1-12 carbon atoms, and most preferably 1 to 10 carbon atoms, for example, ureido group, methylureido group, phenylureido group and the like), a phosphoric acid amide group (preferably those having 1 to 14 carbon atoms, more preferably 1 to 12 carbon atoms, and most preferably 1 to 10 carbon atoms, for example, diethylphosphoric acid amide, phenylphosphoric acid amide and the like), hydroxyl group, mercapto group, a halogen atom, cyano group, sulfo group, carboxyl group, nitro group, oxo group, hydroxamic acid group, sulfinio group, hydrazino group, heterocyclic group and the like. The substituents may further have one or more substituents exemplified above.

**[0033]** Examples of the alkyl group represented by  $R^1$  and  $R^2$  include, for example, a linear or branched alkyl group having 1 to 8 carbon atoms, preferably a linear or branched alkyl group having 1 to 5 carbon atoms (for example, methyl group, ethyl group, n-propyl group, isopropyl group, n-butyl group, isobutyl group, sec-butyl group, tert-butyl group, n-pentyl group and the like), and a cyclic alkyl group having 3 to 8 carbon atoms, preferably a cyclic alkyl group having 3 to 5 carbon atoms (for example, cyclopropyl group, cyclobutyl group, cyclopentyl group and the like). The cyclic alkyl group may have a substituent such as an alkyl group and a halogen atom on its ring.

**[0034]** Examples of the aryl group represented by  $R^1$  and  $R^2$  include, for example, an aryl group having 5 to 14 carbon atoms, preferably an aryl group having 5 to 10 carbon atoms (for example, those having benzene ring, naphthalene ring and the like). The aryl group may have a substituent such as an alkyl group, hydroxyl group and a halogen atom on its ring.

**[0035]** Examples of the heterocyclic group represented by  $R^1$  and  $R^2$  include, for example, a heterocyclic group having 3 to 8 ring-membered atoms, preferably 3 to 6 ring-membered atoms, which may be saturated or partially saturated, or may be an aromatic ring. Examples of substituents on the heterocyclic group include, for example, tert-butoxycarbonyl group, benzyloxycarbonyl group and the like.

**[0036]** The ring formed by  $R^1$  and  $R^2$  bound to each other may be a saturated ring, partially saturated ring, or a fused aromatic ring. The ring may preferably be a 6-membered ring, and one or more substituents may be present on the ring. For example,  $R^1$  and  $R^2$  may preferably bind to each other to form a condensed benzene ring, condensed pyridine ring, or condensed tetrahydropyridine ring, or may preferably bind to each other to form tetramethylene group, butamonoenylene group, butadienylene group, azabutadienylene group or the like. One or more substituents such as a halogen atom, a lower alkoxy group, a lower alkoxycarbonyl group, and an alkyl group having 1 to 3 carbon atoms may substitute on the ring.

**[0037]**  $R^3$  may preferably be hydrogen or hydroxyl group.

**[0038]** The 5- or 6-membered heteroaromatic rings represented by  $J^1$  are not particularly limited so far that the rings are heteroaromatic rings containing at least one hetero atom selected from the group consisting of sulfur atom, nitrogen atom and oxygen atom. For example, the ring may preferably be a heteroaromatic ring represented by the following formula (III):

(III)

wherein X, Y and Z independently represent sulfur atom, nitrogen atom, oxygen atom or carbon atom, provided that at least one of X, Y and Z represents a hetero atom selected from the group consisting of sulfur atom, nitrogen atom and oxygen atom; and k represents 0 or 1. More preferably, the heteroaromatic rings shown below may be used.

[0039] W<sup>1</sup> may preferably be -CH<sub>2</sub>O-, -CH=CH- or ethynyl group.

[0040] A<sup>1</sup> may preferably be a phenylene group which may be substituted, a pyridinediyl group which may be substituted, a benzofurandiyl group which may be substituted, a benzo[b]thiophenediyl group which may be substituted, a benzoxazolediyl group which may be substituted, a benzothiazolediyl group which may be substituted, a 4-oxo-pyrido [1,2-a]pyrimidinediyl group which may be substituted, a quinolin-4-one-diyl group which may be substituted, or an azaquinolin-4-one-diyl group which may be substituted. Positions of bonding on these cyclic divalent groups are not particularly limited. Any two of ring-membered carbon atoms can form the bondings. For example, the phenylene group may be any of p-phenylene group, m-phenylene group, and o-phenylene group.

[0041] The types and number as well as positions of substituents which may be present on the divalent cyclic group represented by A<sup>1</sup> are not particularly limited. Examples of the substituents include, for example, an alkyl group which may be substituted (for example, alkyl groups having 1 to 8 carbon atoms, preferably those having 1 to 5 carbon atoms explained above, and examples of substituents on the alkyl group include, for example, a halogen atom, hydroxyl group, an alkyloxy group and the like), a phenyl group which may be substituted, an alkylphenyl group which may be substituted, an alkylpyridyl group which may be substituted, hydroxyl group, amino group and the like. More preferably, a halogen atom, an alkyl group which may be substituted, hydroxyl group, amino group and the like may

be used.

[0042]  $G^1$  may preferably be  $-N(R^4)-CO-$ ,  $-CO-N(R^9)-$  or  $-C(R^{11})=C(R^{12})-$ . These groups are particularly preferred when  $A^1$  is a substituted phenylene group or a substituted pyridinediyl group. Furthermore,  $G^1$  may preferably be  $-C(R^{11})=C(R^{12})-$  or  $m$  is 0, when  $A^1$  is a benzofurandiyl group which may be substituted, a benzo[b]thiophenediyl group which may be substituted, a benzoxazolediyl group which may be substituted, a benzothiazolediyl group which may be substituted, a 4-oxo-pyrido[1,2-a]pyrimidinediyl group which may be substituted, a quinolin-4-one-diyl group which may be substituted, or an azaquinolin-4-one-diyl group which may be substituted.

[0043] The symbol "p" represents an integer of from 0 to 3. When  $A^1$  is a substituted phenylene group or a substituted pyridinediyl group, p may preferably be 0 or 1. When  $A^1$  is a benzofurandiyl group which may be substituted, a benzo[b]thiophenediyl group which may be substituted, a benzoxazolediyl group which may be substituted, a benzothiazolediyl group which may be substituted, a 4-oxo-pyrido[1,2-a]pyrimidinediyl group which may be substituted, a quinolin-4-one-diyl group which may be substituted, or an azaquinolin-4-one-diyl group which may be substituted, p may preferably be 0.

[0044] When  $A^1$  is a benzofurandiyl group which may be substituted, a benzo[b]thiophenediyl group which may be substituted, a benzoxazolediyl group which may be substituted, a benzothiazolediyl group which may be substituted, a 4-oxo-pyrido[1,2-a]pyrimidinediyl group which may be substituted, a quinolin-4-one-diyl group which may be substituted, or an azaquinolin-4-one-diyl group which may be substituted, both of p and n may preferably be 0.

[0045] When  $G^2$  represents a phenylene group which may be substituted, examples of preferred substituents on the benzene ring include, for example,  $-CH_2OH$ ,  $-COR^c$  [wherein  $R^c$  is  $-NH(R^d)$  or  $-N(R^e)(R^f)$  ( $R^d$  represents hydrogen atom or an alkyl group, and  $R^e$  and  $R^f$  independently represent hydrogen atom or an alkyl group, or  $R^e$  and  $R^f$  binds to each other to represent an alkylene group),  $-CH_2COR^g$  ( $R^g$  represents hydroxyl group, an alkoxy group,  $-NH(R^d)$  or  $-N(R^e)(R^f)$  (wherein  $R^d$ ,  $R^e$  and  $R^f$  have the same meanings as those defined above)), aminoethoxy group, hydroxyethoxy group, a halogen atom, an alkoxy group, an acyloxy group, hydroxyl group, an alkyl group, nitro group, trifluoromethyl group, cyano group and the like.

[0046] When  $G^2$  represents  $-C(R^{21})(R^{22})-C(R^{23})(R^{24})-$ , the ring formed by  $R^{21}$  and  $R^{22}$  bound to each other, the ring formed by  $R^{23}$  and  $R^{24}$  bound to each other, or the ring formed by  $R^{21}$  and  $R^{23}$  bound to each other may be either saturated or unsaturated, and the ring may contain one or more hetero atoms selected from the group consisting of sulfur atom, nitrogen atom, and oxygen atom. One or more substituents (for example, an alkyl group) may be present on the ring.

[0047] Types of the acidic groups represented by  $Q^1$  are not particularly limited, and the acidic group may be a cyclic or non-cyclic substituent, or a combination thereof. Examples include a lower alkoxy group, hydroxyl group, carboxyl group, N-cyanocarboxamide group, a methanesulfonylamide group having 1 to 3 fluorine atoms, an alkoxy carbonyl group which may be substituted,  $-CONH-(5\text{-tetrazolyl})$  group, a 5-tetrazolyl group which may be substituted, a 1,2,3-triazolyl group which may be substituted, a 2,4-dioxothiazolidin-5-ylidenyl group which may be substituted, a 4-oxo-2-thioxothiazolidin-5-ylidenyl group which may be substituted, a 5-oxo-4-tetrazolyl group which may be substituted, a 3-(5-oxo)-[1.2.4]oxadiazolidinyl group which may be substituted, a 2-(3,5-dioxo)-[1.2.4]oxadiazolidinyl group which may be substituted, a 3-(5-oxo)-[1.2.4]isoxazolidinyl group which may be substituted, and the like. More preferred examples include carboxyl group, N-cyanocarboxamide group, methanesulfonylamide group that has 1-3 fluorine atoms, an alkoxy carbonyl group which may be substituted,  $-CONH-(5\text{-tetrazolyl})$  group, a 5-tetrazolyl group which may be substituted and the like.

[0048] As  $R^{31}$ ,  $R^{32}$ ,  $J^1$ , m and  $Q^{11}$  in the compounds represented by the general formula (II), those explained above as for  $R^1$ ,  $R^2$ ,  $J^1$ , m and  $Q^1$  may preferably be used, respectively.

[0049]  $-CH_2O-$ ,  $-CH=CH-$  or  $-CH_2CH_2-$  may preferably be used as  $W^{11}$ . A pyridinediyl group which may be substituted, a 4-oxo-pyrido[1,2-a]pyrimidinediyl group which may be substituted, a quinolin-4-one-diyl group which may be substituted, or an azaquinolin-4-one-diyl group may preferably be used as  $A^{11}$ , and preferred substituents on the ring include a halogen atom, an alkyl group which may be substituted, hydroxyl group, an alkoxy group, amino group or the like.  $G^{11}$  may preferably be  $-N(R^{33})-CO-$ ,  $-CO-N(R^{36})-$  or  $-C(R^{38})=C(R^{39})-$  (wherein  $R^{33}$ ,  $R^{36}$ ,  $R^{38}$  and  $R^{39}$  independently represent hydrogen atom or an alkyl group which may be substituted). Those wherein m is 0 are also preferred.

[0050] The compounds represented by the aforementioned general formulas (I) and (II) may form a salt. Where an acidic group is present, examples of the salt include salts with alkali metals and alkaline earth metals such as lithium, sodium, potassium, magnesium and calcium; salts with ammonia, monomethylamine, dimethylamine, trimethylamine, dicyclohexylamine, tris(hydroxymethyl)aminomethane, N,N-bis(hydroxyethyl)piperazine, 2-amino-2-methyl-1-propanol, ethanolamine, N-methylglucamine, L-glucamine and the like; and salts with basic amino acids such as lysine,  $\delta$ -hydroxylysine, arginine and the like. Where a basic group is present, examples of the salt include, for example, salts with mineral acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid and phosphoric acid; salts with organic acids such as methanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid, acetic acid, propionic acid, tartaric acid, fumaric acid, maleic acid, malic acid, oxalic acid, succinic acid, citric acid, benzoic acid, mandelic acid, cinnamic acid, lactic acid, glycolic acid, glucuronic acid, ascorbic acid, nicotinic acid and salicylic acid; and salts with

acidic amino acids such as aspartic acid and glutamic acid.

**[0051]** As an active ingredient of the medicament according to the present invention, the compounds represented by the general formula (I) or salts thereof, as well as solvates thereof or hydrates thereof can be used. The compounds represented by the aforementioned general formula (I) may have one or more asymmetric carbon atoms. As for the stereochemistry of the asymmetric carbon atoms, each asymmetric carbon atom may independently be in either (R)-configuration or (S)-configuration, and the compounds may exist as stereoisomers such as optical isomers and diastereoisomers. As the active ingredient of the medicament of the present invention, any one of possible stereoisomers in a pure form, any mixtures thereof, racemates thereof and the like may be used. Where the compounds represented by the aforementioned general formula (I) have a double bond, the compounds may be in either (E)-configuration or (Z)-configuration, and any geometrical isomer in a pure form or any mixture thereof can be used as an active ingredient of the medicament of the present invention. The compounds represented by the aforementioned general formula (I) may exist as tautomers depending on a type of a substituent, and any tautomers may be used as an active ingredient of the medicament of the present invention.

**[0052]** The scope of the present invention relating to the novel compounds represented by the aforementioned general formula (II) encompasses compounds in free form and salts thereof as well as solvates thereof and hydrates thereof. The compounds represented by the aforementioned general formula (II) may have one or more asymmetric carbon atoms. As for the stereochemistry of the asymmetric carbon atoms, each asymmetric carbon atom may independently be in either (R)-configuration or (S)-configuration, and the compounds may exist as stereoisomers such as optical isomers and diastereoisomers. Any stereoisomers thereof in a pure form, any mixtures thereof, racemates thereof and the like fall within the scope of the present invention. Where the compounds represented by the aforementioned general formula (II) have a double bond, the compounds may be in either (E)-configuration or (Z)-configuration, and geometrical isomers in pure form and any mixtures thereof fall within the scope of the present invention. The compounds represented by the aforementioned general formula (II) may exist as tautomers depending on a type of a substituent, and any tautomers fall within the scope of the present invention.

**[0053]** The compounds represented by the aforementioned general formula (I) can be prepared by known methods. For example, those wherein J<sup>1</sup> is a thiazole derivative can be prepared according to the methods described in Japanese Patent Unexamined Publication Nos. 62-142168/1987, 6-80654/1994, 10-195063/1998, International Publication Nos. WO96/33181, WO 98/57935 and the like. The compounds wherein J<sup>1</sup> is a quinoline derivative can be prepared by, for example, the method described in Japanese Patent Unexamined Publication No. 7-179426/1995. Other derivatives can also be prepared in similar manners.

**[0054]** For example, a compound wherein G<sup>1</sup> moiety is -NHCO- can be prepared according to the method shown in Scheme 1 below.

&lt;Scheme 1&gt;

[0055] A nitroaryl derivative having carboxyl group is allowed to react with a chlorination agent such as thionyl chloride, and then the product is treated with aqueous ammonia to obtain a carboxamide compound. The carboxamide compound can be converted into a thioamide compound by using the Lawesson's reagent in an inert solvent such as diethyl ether, tetrahydrofuran (THF), toluene and benzene, and the thioamide compound is then condensed with a haloketone, which is commercially available or known, per se, or can be produced by a known method, to obtain Compound 5. An amine compound is prepared by treating the nitro group with a known reducing agent such as tin chloride in an inert alcoholic solvent such as ethanol, or under a reducing condition such as catalytic hydrogenation. Then, the resulting amine derivative is allowed to react with a corresponding carboxylic acid derivative, corresponding carboxylic acid anhydride derivative or the like to obtain a condensate. The reaction may be performed in the presence or absence of a condensing reagent for carboxylic acid and amine, for example, dicyclohexylcarbodiimide, N,N-bis (2-oxo-3-oxazolidinyl)phosphinic acid chloride, dimethylaminopyridine and the like. A compound whose acidic group moiety of Q<sup>1</sup> is protected is subjected to deprotection by using a suitable reagent to obtain a compound represented by the formula 1A. The deprotection can be performed, for example, by applying alkali or acid hydrolysis or catalytic hydrogenation to a carboxylic acid ester, or by treating p-methoxybenzyl-protected tetrazole group with a strong acid such as trifluoroacetic acid in the presence or absence of anisole and the like.

[0056] A compound wherein W<sup>1</sup> moiety is ethynyl group can also be prepared by the method shown in Scheme 2 set out below.

&lt;Scheme 2&gt;

[0057] 2-Ethynylthiazole that can be prepared by a known method and Compound 10 wherein L represents a leaving group such as a halogen atom and trifluoromethanesulfonate can be coupled to obtain a condensate in an organic amine solvent such as triethylamine or diisopropylamine in the presence of an inert solvent, if required, (for example, tetrahydrofuran, 1,2-dimethoxyethane, diethylformamide and the like) at a temperature within a range of 0°C to the boiling point of the solvent according to a method known per se. The reaction may be performed in the presence or absence of triphenylphosphine and cuprous iodide, or by adding a catalytic amount of palladium [2] acetate, tetrakis (triphenylphosphine)palladium [0], or bis(triphenylphosphine)palladium [2] dichloride. After the coupling, a protective group for the acidic group moiety of Q can be eliminated, if required, to obtain a compound represented by the formula 1B.

[0058] A compound wherein W<sup>1</sup> moiety is bound by means of an ether bond can also be prepared by the method shown in the following Scheme 3.

## &lt;Scheme 3&gt;

35 [0059] An alcoholic derivative and a phenol derivative can be subjected to the Mitsunobu reaction to obtain a condensate, i.e., treating the derivatives in the presence of diethyl azodicarboxylate and triphenylphosphine in an inert solvent such as tetrahydrofuran. The resulting condensate can be converted into a compound represented by the formula 1C in the same manners as those shown in Scheme 1.

40 [0060] A compound wherein  $\text{W}^1$  moiety is bound with ethenyl group can also be prepared by the method shown in the following Scheme 4.

## &lt;Scheme 4&gt;

[0061] A compound represented by the formula 1D can be obtained by subjecting Compound 13 and Compound 14, or alternatively Compound 15 and Compound 16, to the Horner-Emonds reaction, and then reducing the nitro group of the resulting Compound 17 with stannous chloride, followed by condensing the product with a corresponding carboxylic acid or a corresponding carboxylic acid anhydride.

[0062] The compounds of the present invention represented by the general formula (II) can be prepared according to the following methods. However, the methods for preparing the compounds of the present invention are not limited to the methods explained below. Preparations of typical compounds of the present invention are specifically explained in the examples of the specification, and accordingly, any compound falling within the general formula (II) can be prepared by appropriately choosing starting materials, reagents, reaction conditions and the like by referring to the following general explanations of synthetic methods and specific explanations in examples, and by adding modifications or alterations to the disclosed methods, if necessary.

[0063] A compound whose  $\text{J}^{11}$  is an heteroaromatic ring represented by the aforementioned formula (III) can be prepared according to the method shown in the following scheme 5.

## &lt;Scheme 5&gt;

[0064] Compound 21 can be obtained by heating Compound 19, which is known per se, or can easily be obtained by a known compound, with diethyl ethoxymethylenemalonate in a solvent such as Dowtherm A, propionic acid, PPA and PPE. The resulting Compound 21 can be treated under conditions of ordinary hydrolysis to obtain a carboxylic acid (compound of the formula 18A). Similarly, Compound 23 can be obtained by condensing Compound 19 with dimethyl acetylenedicarboxylate in a similar manner. The resulting Compound 23 can be treated under conditions of ordinary hydrolysis to obtain a carboxylic acid (compound of the formula 18B).

## &lt;Scheme 6&gt;

[0065] Where the nitrogen atoms of Compound 21 and Compound 23 have hydrogen atom, compounds having a substituent introduced on the nitrogen atoms (compounds of the formulas 18C and 18D) can be obtained by treating the starting compounds with a base such as sodium hydride and potassium carbonate in a solvent such as dimethyl-

formamide (DMF) and THF, and then reacting with an electrophilic agent such as an alkyl halide, followed by hydrolyzing the products.

## &lt;Scheme 7&gt;

[0066] A compound having tetrazole instead of the carboxylic acid (Compounds 18E, F) can be prepared by carrying out the condensation by using known Compound 24 (Chem. Pharm. Bull., 1991, 39, 1099) instead of the diethyl ethoxymethylenemalonate, and treating the product with a strong acid such as trifluoroacetic acid.

[0067] A compound of the formula 19A can be prepared by the method shown in the following Scheme 8.

## &lt;Scheme 8&gt;

[0068] A condensate (Compound 27) can be obtained by carrying out the Mitsunobu reaction by using a 3-hydroxynitrobenzene derivative (Compound 26) and Compound 10. A compound of the formula 19A can be obtained by treating the nitro group of Compound 27 with stannous chloride in an alcohol, or subjecting the nitro group to catalytic

reduction.

[0069] A compound of the formula 19B can be prepared according to the method shown in the following Scheme 9.

## &lt;Scheme 9&gt;

[0070] A compound of the formula 19B can be obtained by treating a 3-nitrobenzaldehyde derivative (Compound 28) and Compound 15 with a base such as sodium methoxide in methanol, and then reducing the nitro group by a treatment with stannous chloride in an alcohol.

[0071] A compound of the formula 19C can be prepared by the method shown in the following Scheme 10.

## &lt;Scheme 10&gt;

[0072] A compound of the formula 19C can be obtained by heating N-acetyl- or N-pivaloyl-2-pyridine-4-aldehyde

(Compound 31, International Publication No. WO93/07141) and Compound 30 in acetic anhydride, and then hydrolyzing the product in hydrochloric acid.

[0073] Compounds of the formulas 19D and 19E can be prepared by the method shown in the following Scheme 11.

<Scheme 11>

[0074] A compound of the formula 19D can be obtained by treating tert-butyl N-(4-methyl-2-pyridyl)carbamate (Compound 33: J. Org. Chem., 1996, 61, 4810) with n-butyllithium in THF and then reacting with a corresponding alkyl halide (Compound 32), followed by treating the product with a strong acid such as trifluoroacetic acid. Compound 35 can be obtained by treating ethyl 4-hydroxypyridine-2-carboxylate (Compound 34, EP-A-0330353) with a base such as potassium carbonate in DMF, and allowing the product to react with a corresponding alkyl halide (Compound 32). A compound of the formula 19E can be obtained by hydrolyzing the ester moiety of Compound 35, subjecting the hydrolysate to the Curtius rearrangement using diphenylphosphoryl azide and t-butanol, and then treating the resulting t-butyl carbonate with a strong acid such as trifluoroacetic acid.

[0075] A compound of the formula 18G can be prepared by the method shown in the following Scheme 12.

## &lt;Scheme 12&gt;

Formula 18G

[0076] Compound 10 can be converted into an alkoxide by a treatment with a strong base such as sodium hydride in DMF or THF, and then subjected to reaction with known Compound 36 (for example, Japanese Patent Unexamined Publication Nos. 61-246188/1986, 62-12760/1987 and 60-197686/1985). Then, the resulting product can be converted into a carboxylic acid (compound of the formula 18G) by hydrolysis.

[0077] The synthetic intermediates and the target compounds in the aforementioned preparations can be isolated and purified by using methods for isolation and purification ordinarily used in the field of organic synthetic chemistry, for example, neutralization, filtration, extraction, drying, concentration, recrystallization, various chromatographic techniques and the like. The synthetic intermediates may be used in subsequent reactions without purification. When a salt of compound of the general formula (I) or (II) is desired, a product obtained in the form of a salt may be purified without any treatment. When a product is obtained in a free form, a salt can be formed by dissolving or suspending the product in a suitable organic solvent, and then adding an acid or base. It is also possible to convert a compound represented by the general formula (I) or (II) obtained in the form of a salt into a compound in a free form, and then convert the result into an appropriate salt.

[0078] Although it is not intended to be bound by any specific theory, the compounds represented by the general formula (I) have an activity for inhibiting drug efflux pumps of microorganisms. More specifically, the compounds represented by the general formula (I) can act on a microorganism with acquired resistance to an antimicrobial agent to inhibit its drug efflux pump, and eliminate the resistance of the microorganism. In addition, the compounds represented by the general formula (I) can act on a microorganism to inhibit a drug efflux pump, thereby suppress the acquisition of resistance to an antimicrobial agent by a microorganism. Therefore, the medicament of the present invention that comprises a compound represented by the general formula (I) as an active ingredient is useful for preventive and/or therapeutic treatment of microbial infections, generally by a combinational administration with an antimicrobial agent. The medicament of the present invention is extremely useful as a medicament for preventive and/or therapeutic treatment of, in particular, infectious diseases caused by a microorganism with acquired resistance to one or more antimicrobial agents.

[0079] Methods for using the medicament of the present invention are not particularly limited. Examples include a method of administering one or more antimicrobial agents, and also administering the medicament of the present invention simultaneously, separately, or successively to enhance the activity of the antimicrobial agent(s); and a method of preparing a pharmaceutical composition comprising one or more antimicrobial agents and the medicament of the present invention (so-called a compound drug) and the administering the composition.

[0080] Kinds of microbial infections that are applicable by the medicament of the present invention are not particularly limited. Bacteria are suitable as target microorganisms. The medicament of the present invention can be used for various infections by microorganisms including Gram-positive or Gram-negative bacteria, aerobic or anaerobic bacteria and the like. The medicament of the present invention can most suitably be used for infections by *Pseudomonas aeruginosa* with acquired resistance to one or more antimicrobial agents, or infection by *Pseudomonas aeruginosa* with low sensitivity to antimicrobial agents. The medicament of the present invention can be used for microbial infections of mammals including human.

[0081] Drugs having variety of structures have been known as antimicrobial agents, and various drugs are clinically used. Kinds of antimicrobial agents that can be administered in combination with the medicament of the present invention are not particularly limited, and examples include, for example, penicillin (penam) antibiotics, cephalosporin (cephem) antibiotics, oxacephem antibiotics, penem antibiotics, carbapenem antibiotics, monobactam antibiotics, aminoglycoside antibiotics, macrolide antibiotics, chloramphenicol antibiotics, tetracycline antibiotics, glycopeptide antibiotics, phosphomycin antibiotics, lincomycin antibiotics, sulfonamide preparations, p-aminosalicylic acid preparations, isonicotinic acid hydrazide preparations, quinolone synthetic antimicrobial agents and the like. However, antimicrobial agents are not limited to these examples. When a pharmaceutical composition comprising one or more antimicrobial agents together with the medicament of the present invention is manufactured, the antimicrobial agents exemplified above can also be used.

[0082] As the active ingredient of the medicament of the present invention, a substance selected from the group consisting of the compounds represented by the formula (I) and pharmaceutically acceptable salts thereof, and hydrates thereof and solvates thereof can be used. Two or more of the substances may be used in combination. The aforementioned substance, per se, may be administered as the medicament of the present invention. Generally, however, it is desirable that the substance is administered in the form of a pharmaceutical composition comprising one or more of the aforementioned substances as the active ingredient together with one or more pharmaceutical additives. The pharmaceutical composition may optionally be added with one or more of other pharmaceutically active ingredients such as the aforementioned antimicrobial agents and  $\beta$ -lactamase inhibitors.

[0083] A pharmaceutical composition for the use of administration *in vivo* can be readily prepared by mixing one or more of the aforementioned substances as the active ingredient and one or more pharmaceutically acceptable additives for pharmaceutical preparations according to methods for formulation ordinarily used in the field of manufacturing pharmacy. The route of administration of the medicament of the present invention is not particularly limited; however, it is desirable to appropriately choose the most effective administration route for preventive and/or therapeutic treatment of a target infectious disease. Examples of pharmaceutical compositions suitable for oral administration include, for example, capsules, powders, tablets, granules, sublingual granules, emulsions, syrups, solutions, suspensions and the like. Examples of pharmaceutical compositions suitable for parenteral administration include, for example, inhalants, sprays, intrarectal preparations, injections, drip infusions, ointments, creams, transdermal preparations, transmucosal preparations, eye drops, nasal drops, ear drops, tape preparations, patches and the like. However, the forms of the medicament of the present invention are not limited to these examples.

[0084] Among the pharmaceutical compositions suitable for oral administration, liquid preparations such as emulsions and syrups can be prepared by using pharmaceutical additives including water; saccharides such as sucrose, sorbitol, fructose; glycols such as polyethylene glycol and propylene glycol; oils such as sesame oil, olive oil and soybean oil; antiseptics such as p-hydroxybenzoic acid esters; flavors such as strawberry flavor and peppermint and the like. Solid preparations such as capsules, tablets, powders and granules can be prepared by using excipients such as lactose, glucose, sucrose and mannitol; disintegrating agents such as starch and sodium alginate; lubricants such as magnesium stearate and talc; binders such as polyvinyl alcohol, hydroxypropylcellulose and gelatin; surfactants such as fatty acid esters; plasticizers such as glycerin and the like.

[0085] Among the pharmaceutical compositions suitable for parenteral administration, liquid preparations such as injections, drip infusions and eye drops can preferably be prepared as sterilized isotonic liquid preparations. For example, injections can be prepared by using an aqueous medium such as a solution of sodium chloride, a solution of glucose, or a mixture of saline and glucose solution. The intrarectal preparations can be prepared generally in the form of suppositories by using carriers such as cacao butter, hydrogenated fat and hydrogenated carboxylic acid. For the preparation of sprays, a non-irritable carrier can be used that enables fine dispersion and enhances absorption of the aforementioned substances as the active ingredient. Examples of such a carrier include lactose, glycerin and the like. Aerosols, dry powders or the like can also be chosen as the form of preparation. However, pharmaceutical additives used for the manufacture of the medicament of the present invention are not limited to those mentioned above, and any additives available for those skilled in the art can be used.

[0086] A dose and frequency of administration of the medicament of the present invention are not particularly limited, and a suitable dose can be chosen depending on the type and severity of a microbial infection, the presence or absence of an underlying disease, the age and body weight of a patient and the like.

[0087] The compound provided as another aspect of the present invention is characterized in that its partial structure

occupies the following four sites in the following tolerance. The compounds provided by the present invention have a pharmacophore comprising the following four sites as a common pharmacophore to exert an inhibitory activity against drug efflux pumps of *Pseudomonas aeruginosa*. Each of Sites 1 to 3 shows a hydrophobic feature, and Site 4 shows a negatively ionizable (acidic group) feature. Definitions of these features are described in the following literature or the cited references in the literature (J. Chem. Inf., and Comp. Sci., 34, 1297-1308).

Site	Feature	x(Å)	y(Å)	z(Å)	Tolerance (Å)
1	Hydrophobic	8.839	-0.324	1.49	2
2	Hydrophobic	4.819	1.836	-0.29	1.7
3	Hydrophobic	-1.722	-0.964	0.89	1.7
4	Negative Ionizable	-8.636	-1.067	-2.554	2

[0088] In the aforementioned pharmacophore, more specifically, the hydrophobic feature represents a position occupied by a hydrophobic substituent in the partial structure of the compound. Examples of the hydrophobic substituent include functional groups such as, for example, an alkyl group, a cycloalkyl group, an aryl group, a heterocyclic group, or a halogen atom. However, the substituents are not limited to these examples. The site of an acidic group represents a position occupied by an acidic group in the partial structure of the compound.

[0089] Examples of the substituent occupying Site 1 include, for example, an alkyl group, an aryl group, a heterocyclic group, a halogen atom and the like, and an alkyl group, an aryl group, or a heterocyclic group is preferred. These groups may further have one or more substituents.

[0090] Examples of the substituent occupying Site 2 include an alkyl group, an aryl group, a heterocyclic group, a halogen atom and the like, and an aryl group or a heterocyclic group is preferred. These groups may further have one or more substituents.

[0091] Examples of the substituent occupying Site 3 include an alkyl group, an aryl group, a heterocyclic group, a halogen atom and the like, and an aryl group or a heterocyclic group is preferred. These groups may further have one or more substituents.

[0092] The type of the acidic group occupying Site 4 is not particularly limited, and the acidic group may be cyclic, acyclic, or a combination thereof. The acidic group may further have one or more substituents.

[0093] A structural moiety connecting each of the sites is referred to as a linker. The linker comprises, for example, carbon atom, oxygen atom, nitrogen atom, sulfur atom or the like as a constitutional element, and has a length required to have the partial structures of the compound fit in each of the sites. However, the kind of the linker is not particularly limited. Specifically, examples of the linker include those selected from the group consisting of -CH=CH-, -C≡C-, -CH<sub>2</sub>CH<sub>2</sub>-, -OCH<sub>2</sub>-, -SCH<sub>2</sub>-, -OCH<sub>2</sub>O-, -CH<sub>2</sub>O-, -CH<sub>2</sub>-, -CO-, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-, -CH<sub>2</sub>NH-, -NHCH<sub>2</sub>-, -CH<sub>2</sub>S-, -CONH-, -CH<sub>2</sub>SCH<sub>2</sub>-, -CH=CH-CONH- and -CH<sub>2</sub>OCH<sub>2</sub>-, and those containing a combination of these linkers. Some of the aforementioned linkers have geometrical isomerism, and any of such isomers may be used.

[0094] Examples of the compound having the aforementioned pharmacophore include those represented by the aforementioned general formula (I) or (II). However, the compounds are not limited to these compounds.

[0095] R<sup>1</sup>, R<sup>2</sup>, R<sup>31</sup> and R<sup>32</sup> are partial structures occupying Site 1, J<sup>1</sup> and J<sup>11</sup> are those occupying Site 2, A<sup>1</sup> and A<sup>11</sup> are those occupying Site 3, and Q<sup>1</sup> and Q<sup>11</sup> correspond to those occupying Site 4. The term "occupy" means that each structure itself or atoms constituting each structure (substituent) take an arbitrary locus in an inner space of a sphere defined as the site.

[0096] By using the aforementioned pharmacophore, it can be determined whether or not a compound has an inhibitory activity against the drug efflux pump of *Pseudomonas aeruginosa*. In addition, a compound having an inhibitory activity against the drug efflux pump of *Pseudomonas aeruginosa* can be selected by carrying out screening in which the aforementioned pharmacophore model is applied and a library of compounds having generated conformations is used. Moreover, a virtual compound can be created by calculating conformations in the same manner on the basis of a class of virtual compounds, and then carrying out docking study with the aforementioned pharmacophore. A useful medicament can be created by practically synthesizing the virtually created compound and assaying the inhibitory activity against the drug efflux pump of *Pseudomonas aeruginosa*. Appropriate combination of two or more of these techniques may be applicable to find a compound having more potent inhibitory activity against the drug efflux pump of *Pseudomonas aeruginosa*.

[0097] The compounds can be efficiently overlaid by using a software having a docking function such as CATALYST (Greene et al., J. Chem. Inf. Comp. Sci., 1994, 34, 1297-1308; The software is commercially available from Molecular Simulation Inc.), and alternatively, the overlay can manually be performed. As for the creation of a pharmacophore using CATALYST, specific techniques are disclosed in detail in, for example, International Publication WO/04913 and

the like. In general, compounds that fit for a pharmacophore are those wherein, for each of sites, constitutional atoms in a partial structure that conform with the feature of a site are located within 0.5 to 3 Å from the site when they are optimally overlaid with the pharmacophore. A compound whose partial structure occupied within the aforementioned tolerance for all of the four sites of the aforementioned pharmacophore (within 2 Å for Site 1 and Site 4, and within 1.7 Å for Site 2 and Site 3) has an inhibitory action against the drug efflux pump of *Pseudomonas aeruginosa*, and can be expected to have an effect of combination with an antibacterial agent in preventive and/or therapeutic treatment of infectious diseases. The compounds represented by the general formula (I) and (II), as compounds having an inhibitory action against the drug efflux pump of *Pseudomonas aeruginosa*, can be used as active ingredients of medicaments for preventive and/or therapeutic treatment of infectious diseases as well as inhibitors of the drug efflux pump of *Pseudomonas aeruginosa*.

#### Examples

**[0098]** The present invention will be explained more specifically with reference to the following examples. However, the scope of the present invention is not limited to these examples.

Example 1: 2-(2-Oxo-2-3-[(E)-2-(4-phenyl-1,3-thiazol-2-yl)-1-ethenyl]anilinoethyl)-benzoic acid

**[0099]** 3-[(E)-2-(4-Phenyl-1,3-thiazol-2-yl)-1-ethenyl]aniline (Japanese Patent Unexamined Publication No. 62-142168/1987, 500 mg, 1.8 mmol) and homophthalic anhydride (440 mg, 2.7 mmol) were dissolved in toluene (10 mL), and the solution was heated under reflux for 30 minutes. After the reaction mixture was cooled, the deposited crystals were collected by filtration to obtain the title compound as a white solid (720 mg, 91%).

<sup>1</sup>H-NMR (DMSO-d<sub>6</sub>) δ: 4.11 (2H, s), 7.30-7.54 (12H, m), 7.89 (1H, d, J=8.3Hz), 7.96 (1H, s), 7.99 (1H, d, J=7.2Hz), 8.09 (1H, s), 10.18 (1H, s)

Example 2: 2-[2-Oxo-2-[3-(2-quinolylmethoxy)anilino]ethyl]benzoic acid

(A) 2-[(3-Nitrophenyloxy)methyl]quinoline

**[0100]** m-Nitrophenol (500 mg, 3.59 mmol) and 2-chloromethylquinoline (846 mg, 3.95 mmol) were dissolved in DMF (10 ml), and the solution was added with potassium carbonate (745 mg) and stirred overnight at room temperature. The reaction mixture was concentrated, diluted with ethyl acetate, washed with saturated aqueous sodium hydrogen-carbonate and saturated brine, and then dried over magnesium sulfate. The solvent was evaporated under reduced pressure, and the residue was purified by silica gel chromatography (n-hexane:ethyl acetate, 8:1, v/v) to obtain the title compound (245 mg, 24%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 5.45 (2H, s), 7.35 (1H, dd, J=8.3, 2.4Hz), 7.44 (1H, t, J=8.3Hz), 7.58 (1H, t, J=7.8Hz), 7.65 (1H, d, J=8.8Hz), 7.76 (1H, t, J=7.8Hz), 7.84-7.86 (2H, m), 7.92 (1H, d, J=2.0Hz), 8.10 (1H, d, J=8.8Hz), 8.23 (1H, d, J=8.3Hz)

(B) 3-(2-Quinolylmethoxy)aniline

**[0101]** The 2-[(3-nitrophenyloxy)methyl]quinoline obtained in (A) (245 mg, 0.874 mmol) was dissolved in ethanol (10 ml), and the solution was added with stannous chloride (580 mg) and heated under reflux for 3 hours. After the reaction mixture was left stand for cooling, the mixture was added with 5 M aqueous sodium hydroxide (20 ml) and then stirred for 15 minutes. The reaction mixture was extracted with chloroform. The organic layer was dried over magnesium sulfate, and the solvent was evaporated under reduced pressure to obtain the title compound (247 mg, quantitative).

(C) 2-[2-Oxo-2-[3-(2-quinolylmethoxy)anilino]ethyl]benzoic acid

**[0102]** The 3-(2-quinolylmethoxy)aniline obtained in (B) (219 mg, 0.875 mmol) and homophthalic anhydride (213 mg, 0.131 mmol) were dissolved in toluene (10 ml), and the solution was heated under reflux for 30 minutes. The deposited solid was collected by filtration to obtain the title compound as a white solid (223 mg, 62%).

Example 3: 2-(2-3-[(E)-2-(4-Isopropyl-5-chloro-1,3-thiazol-2-yl)-1-ethenyl]anilino-2-oxoethyl)benzoic acid

(A) 4-Isopropyl-5-chloro-2-[(E)-2-(3-nitrophenyl)-1-ethenyl]-1,3-thiazole hydrochloride

[0103] 4-Isopropyl-2-[(E)-2-(3-nitrophenyl)-1-ethenyl]-1,3-thiazole (Japanese Patent Unexamined Publication No. 62-142168/1987, 270 mg, 0.98 mmol) was dissolved in carbon tetrachloride (5 mL), and the solution was added with N-chlorosuccinimide (160 mg, 1.2 mmol) and heated under reflux for 17 hours. The reaction mixture was distributed in methylene chloride and saturated aqueous sodium hydrogencarbonate. The organic layer was washed with saturated brine, and dried over magnesium sulfate, and then the solvent was evaporated under reduced pressure. The residue

was added with a small amount of hydrochloric acid in dioxane, and the solvent was evaporated again. The residue was purified by silica gel chromatography (hexane:ethyl acetate, 4:1, v/v) to obtain the title compound as a white solid (236 mg, 69%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.31 (6H, d, J=6.8Hz), 3.24 (1H, m), 7.30 (2H, s), 7.56 (1H, t, J=7.8Hz), 7.81 (1H, d, J=7.8Hz), 8.16 (1H, dd, J=7.8, 2.0Hz), 8.37 (1H, t, J=2.0Hz)

(B) 2-(2-3-[(E)-2-(4-Isopropyl-5-chloro-1,3-thiazol-2-yl)-1-ethenyl]anilino-2-oxoethyl)-benzoic acid

[0104] The 4-isopropyl-5-chloro-2-[(E)-2-(3-nitrophenyl)-1-ethenyl]-1,3-thiazole hydrochloride obtained in (A) (225 mg, 0.652 mmol) was dissolved in ethanol (10 mL), and the solution was added with tin (II) chloride (590 mg, 3.11 mmol) and heated under reflux for 2 hours. The reaction mixture was added with 4 N aqueous sodium hydroxide, and extracted with ethyl acetate. After the organic layer was washed with saturated brine and dried over sodium sulfate, the solvent was evaporated under reduced pressure. The residue was dissolved in toluene (10 mL), and the solution was added with homophthalic anhydride (126 mg, 0.78 mmol) and heated under reflux for 30 minutes. The reaction mixture was cooled, and the deposited crystals were collected by filtration to obtain the title compound as a white solid (88 mg, 30%).

<sup>1</sup>H-NMR (DMSO-d<sub>6</sub>) δ: 1.23 (6H, d, J=6.8Hz), 3.15 (1H, m), 3.98 (2H, s), 7.25-7.50 (8H, m), 7.80-7.90 (2H, m)

Example 4: 2-[2-Oxo-2-3-[(E)-(5-phenyl-2-furyl)-1-ethenyl]anilino]ethylbenzoic acid

(A) N-Methyl-N-methoxy-5-bromo-2-furanamide

[0105] 5-Bromo-2-furancarboxylic acid (3.00g, 15.7 mmol) was dissolved in methylene chloride (60 ml), and the solution was added with N-methyl-N-methoxyamine hydrochloride (94 mg), triethylamine (2.19 ml, 15.7 mmol) and HOBT (1.06 g, 7.85 mmol). Then, the mixture was added with WSCD-HCl (3.31 g, 17.3 mmol) under ice cooling and then stirred at room temperature for 18 hours. The reaction mixture was diluted with methylene chloride, washed with 10% aqueous citric acid, saturated aqueous sodium hydrogencarbonate and saturated brine, and then dried over magnesium sulfate. The solvent was evaporated under reduced pressure. The residue was purified by silica gel chromatography (n-hexane:ethyl acetate, 4:1, v/v) to obtain the title compound as colorless amorphous (3.18 g, 86%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 3.33 (3H, s), 3.77 (3H, d, J=2.0Hz), 6.45 (1H, dd, J=3.9, 2.0Hz), 7.10 (1H, d, J=3.9Hz)

(B) N-Methyl-N-methoxy-5-phenyl-2-furanamide

[0106] The N-methyl-N-methoxy-5-bromo-2-furanamide obtained in (A) (3.18 g, 13.6 mmol) was dissolved in toluene/water (60 ml, 2:1, v/v), and the mixture was added with phenylboric acid (1.74 g, 14.3 mmol), tetrakis(triphenylphosphine)palladium (785 mg) and sodium carbonate (4.32 g, 40.8 mmol), and then heated under reflux overnight. The reaction mixture was left stand for cooling, and then extracted with ethyl acetate. After the organic layer was dried over magnesium sulfate, the solvent was evaporated under reduced pressure. The residue was purified by silica gel chromatography (n-hexane:ethyl acetate, 4:1, v/v) to obtain the title compound as white crystals (2.27 g, 72%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 3.39 (3H, s), 3.84 (3H, s), 6.77 (1H, d, J=3.9Hz), 7.25 (1H, d, J=3.9Hz), 7.34 (1H, m), 7.43 (2H, t, J=7.3Hz), 7.80 (2H, d, J=7.3Hz)

(C) 5-Phenyl-2-furaldehyde

[0107] Aluminum lithium hydride (410 mg, 10.8 mmol) was suspended in THF (15 ml), and the mixture was added with the N-methyl-N-methoxy-5-phenyl-2-furanamide obtained in (B) (500 mg, 2.16 mmol) under ice cooling and stirred for 30 minutes at 0°C. The reaction mixture was poured into ice water, and the mixture was added with potassium hydrogensulfate and stirred for a while. The reaction mixture was extracted with ethyl acetate, and the organic layer

was dried over magnesium sulfate. After the drying agent was removed by filtration, the solvent was evaporated under reduced pressure. The residue was purified by silica gel chromatography (n-hexane:ethyl acetate, 20:1, v/v) to obtain the title compound (289 mg, 78%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ : 6.83 (1H, d, J=3.9Hz), 7.31 (1H, d, J=3.9Hz), 7.38-7.44 (3H, m), 7.82 (2H, m), 9.64 (1H, s)

(D) Diethyl (3-nitrobenzyl)phosphonate

**[0108]** 3-Nitrobenzyl bromide (1.00 g, 4.63 mmol) was dissolved in triethyl phosphite (15 ml), and the mixture was stirred at 100°C for 3 hours. The reaction mixture was left stand for cooling, and then added with ether. The deposited insoluble substances were removed by filtration, and the mother liquor was evaporated. The residue was purified by silica gel chromatography (n-hexane:ethyl acetate, 4:1 → 1:1, v/v) to obtain the title compound (1.14 g, 90%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ : 1.27 (6H, t, J=7.3Hz), 3.21 (1H, s), 3.27 (1H, s), 4.07 (4H, q, J=7.3Hz), 7.50 (1H, dd, J=8.3, 7.8Hz), 7.66 (1H, d, J=7.8Hz), 8.14 (1H, d, J=8.3Hz), 8.16 (1H, d, J=2.0Hz)

(E) 2-[(E)-2-(3-Nitrophenyl)-1-ethenyl]-5-phenylfuran

**[0109]** The 5-phenyl-2-furaldehyde obtained in (C) (188 mg, 1.09 mmol) and the diethyl (3-nitrobenzyl)phosphonate obtained in (D) (597 mg, 2.18 mmol) were dissolved in DMF (3 ml), and the solution was added with sodium methoxide (118 mg) and stirred at room temperature for 6 hours. The reaction mixture was further added with 5-phenyl-2-furaldehyde (191 mg) and sodium methoxide (118 mg), then added with 60% sodium hydride (88.0 mg) and stirred at room temperature overnight. The reaction mixture was added with methanol, and concentrated under reduced pressure. The resulting residue was diluted with ethyl acetate, and washed with saturated brine. The organic layer was dried over magnesium sulfate, and the solvent was evaporated under reduced pressure. The residue was purified by silica gel chromatography (n-hexane:ethyl acetate, 20:1, v/v) to obtain the title compound as yellow crystals (288 mg, 45%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ : 6.54 (1H, d, J=3.4Hz), 6.73 (1H, d, J=3.4Hz), 7.04 (1H, d, J=16.1Hz), 7.15 (1H, d, J=16.1Hz), 7.30 (1H, t, J=7.8Hz), 7.43 (1H, t, J=7.8Hz), 7.51 (1H, t, J=7.8Hz), 7.76 (3H, m), 8.07 (1H, m), 8.35 (1H, s)

(F) 3-[(E)-(5-Phenyl-2-furyl)-1-ethenyl]aniline

**[0110]** The 2-[(E)-2-(3-nitrophenyl)-1-ethenyl]-5-phenylfuran obtained in (E) (288 mg, 0.989 mmol) was dissolved in ethanol (15 ml), and the solution was added with stannous chloride (656 mg) and heated under reflux for 3 hours. The reaction mixture was left stand for cooling, and then added with 5 M aqueous sodium hydroxide (20 ml) and stirred for 15 minutes. The mixture was then extracted with chloroform, and the organic layer was dried over magnesium sulfate. The solvent was evaporated under reduced pressure to obtain the title compound (259 mg, quantitative).

(G) 2-[2-Oxo-2-{3-[(E)-(5-phenyl-2-furyl)-1-ethenyl]anilino}ethyl]benzoic acid

**[0111]** The 3-[(E)-(5-phenylfuryl)-1-ethenyl]aniline obtained in (F) (259 mg, 0.987 mmol) and homophthalic anhydride (240 mg, 0.148 mmol) were dissolved in toluene (7 ml), and the solution was heated under reflux for 30 minutes. The deposited solids were collected by filtration to obtain the title compound as a white solid (302 mg, 72%).

<sup>1</sup>H-NMR (DMSO-d<sub>6</sub>) δ : 4.11 (2H, s), 6.69 (1H, d, J=3.42), 7.02 (1H, d, J=16.2Hz), 7.03 (1H, d, J=3.4Hz), 7.09 (1H, d, J=16.2Hz), 7.27-7.46 (8H, m), 7.53 (1H, t, J=7.3Hz), 7.79 (2H, d, J=7.8Hz), 7.89 (2H, d, J=7.3Hz), 7.92 (1H, s), 10.1 (1H, s)

Example 5: 2-[2-{3-[(E)-2-(5-Amino-4-isopropyl-1,3-thiazol-2-yl)-1-ethenyl]amino}-2-oxoethyl]benzoic acid

(A) Ethyl 4-isopropyl-2-[(E)-2-(3-nitrophenyl)-1-ethenyl]-1,3-thiazole-5-carboxylate

**[0112]** (E)-3-(3-Nitrophenyl)-2-propenethioamide (2.07 g, 9.99 mmol) and ethyl 2-chloro-4-methyl-3-oxopentanoate (1.92 g, 9.99 mmol) were dissolved in ethanol (100 ml), and the solution was heated under reflux for 26 hours. The reaction mixture was left stand for cooling and then concentrated. The residue was purified by silica gel chromatography (n-hexane:ethyl acetate, 20:1, v/v) to obtain the title compound (812 mg, 24%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ : 1.34 (6H, d, J=9.8Hz), 1.39 (3H, t, J=7.3Hz), 3.99 (1H, m), 4.36 (2H, q, J=7.3Hz), 7.36 (1H, d, J=16.1Hz), 7.56 (1H, d, J=16.1Hz), 7.58 (1H, t, J=8.3Hz), 7.85 (1H, d, J=8.3Hz), 8.19 (1H, dd, J=8.3, 2.0Hz), 8.41 (1H, brs)

(B) 4-isopropyl-2-[(E)-2-(3-nitrophenyl)-1-ethenyl]-1,3-thiazole-5-carboxylic acid

[0113] The ethyl 4-isopropyl-2-[(E)-2-(3-nitrophenyl)-1-ethenyl]-1,3-thiazole-5-carboxylate obtained in (A) (250 mg, 0.722 mmol) was dissolved in a mixed solvent of THF, methanol and water (6 ml, 3:2:1, v/v), and the solution was added with lithium hydroxide monohydrate (60.6 mg) and stirred at room temperature for 3 hours. The reaction mixture was neutralized with 1 M hydrochloric acid, and extracted with ethyl acetate. The organic layer was dried over magnesium sulfate. The solvent was evaporated under reduced pressure to obtain the title compound (247 mg, quantitative).

(C) tert-Butyl N-[4-isopropyl-2-[(E)-2-(3-nitrophenyl)-1-ethenyl]-1,3-thiazol-5-yl]-carbamate

[0114] The 4-isopropyl-2-[(E)-2-(3-nitrophenyl)-1-ethenyl]-1,3-thiazole-5-carboxylic acid obtained in (B) (230 mg, 0.722 mmol) was dissolved in tert-butanol (8 ml), and the solution was added with triethylamine (0.121 ml) and diphenyl phosphoric acid azide (0.187 ml), and then heated under reflux for 6 hours. The reaction mixture was left stand for cooling, and then diluted with ethyl acetate and washed with 10% aqueous citric acid, saturated aqueous sodium hydrogencarbonate, and then with saturated brine. The reaction mixture was dried over magnesium sulfate, and the solvent was evaporated under reduced pressure. The residue was purified by silica gel chromatography (n-hexane: ethyl acetate, 8:1, v/v) to obtain the title compound (272 mg, 97%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.32 (6H, d, J=6.8Hz), 1.54 (9H, s), 2.93 (1H, m), 6.66 (1H, br), 7.23 (1H, d, J=16.1Hz), 7.33 (1H, d, J=16.1Hz), 7.52 (1H, dd, J=8.3, 7.8Hz), 7.76 (1H, d, J=7.8Hz), 8.10 (1H, dd, J=8.3, 1.5Hz), 8.33 (s, 1H)

(D) tert-Butyl N-[4-isopropyl-2-[(E)-2-(3-aminophenyl)-1-ethenyl]-1,3-thiazol-5-yl]-carbamate

[0115] The tert-butyl N-[4-isopropyl-2-[(E)-2-(3-nitrophenyl)-1-ethenyl]-1,3-thiazol-5-yl]carbamate obtained in (C) (272 mg, 0.698 mmol) was dissolved in ethanol (10 ml), and the solution was added with stannous chloride (463 mg) and heated under reflux for 3 hours. The reaction mixture was left stand for cooling, and then added with 5 M aqueous sodium hydroxide (20 ml) and stirred for 15 minutes. The reaction mixture was extracted with ethyl acetate, and the organic layer was dried over magnesium sulfate. The solvent was evaporated under reduced pressure to obtain the title compound (241 mg, 96%).

(E) 2-[2-[3-[(E)-2-[5-[(tert-butoxycarbonyl)amino]-4-isopropyl-1,3-thiazol-2-yl]-1-ethenyl]amino]-2-oxoethyl]benzoic acid

[0116] The tert-butyl N-[4-isopropyl-2-[(E)-2-(3-amino phenyl)-1-ethenyl]-1,3-thiazol-5-yl]carbamate obtained in (D) (241 mg, 0.670 mmol) and homophthalic anhydride (163 mg, 1.01 mmol) were dissolved in toluene (8 ml), and the solution was heated under reflux for one hour. The deposited solid was collected by filtration to obtain the title compound as a white solid (244 mg, 70%).

Example 6: 2-(2-Oxo-2-[3-[(E)-2-(pyrido[3,2-d][1,3]thiazol-2-yl)-1-ethenyl]anilino)-ethyl)benzoic acid

(A) N1-(2-Chloro-3-pyridyl)-(E)-3-(3-nitrophenyl)-2-propeneamide

[0118] (E)-3-(3-Nitrophenyl)-2-propenoic acid (6.02 g, 31.2 mmol) was suspended in toluene (250 ml), and the suspension was added dropwise with thionyl chloride (2.7 ml, 37.4 mmol), and then heated under reflux for one and half

hours. After the reaction mixture was cooled, the solvent and excessive reagents were evaporated. The residue was subjected to azeotropy by using toluene to obtain (E)-3-(3-nitrophenyl)-2-propenoyl chloride as a white solid.

[0119] This solid was suspended in THF (100 ml), and the suspension was added with 3-amino-2-chloropyridine (4.01 g, 31.2 mmol) under ice cooling, and then stirred at the same temperature for 5 minutes and further at room temperature for 19 hours. The reaction mixture was added with saturated aqueous sodium hydrogencarbonate, and the insoluble solids were collected by filtration. The solids were again suspended in chloroform:methanol (10:1, v/v), washed with saturated aqueous sodium hydrogencarbonate and saturated brine, and then dried over anhydrous sodium sulfate. The solvent was evaporated to obtain the title compound as a white solid (1.00 g, 10.6%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 6.97 (1H, d, J=15.6Hz), 7.36 (1H, t, J=4.9Hz), 7.64 (1H, t, J=7.8Hz), 7.83 (1H, d, J=15.6Hz), 7.92 (1H, d, J=8.3Hz), 8.16 (1H, d, J=4.9Hz), 8.26 (1H, dd, J=8.3, 1.0Hz), 8.49 (1H, m), 8.75 (1H, d, J=6.8Hz)

(B) 2-[(E)-2-(3-Nitrophenyl)-1-ethenyl]pyrido[3,2-d][1,3]thiazole

[0120] The N<sup>1</sup>-(2-chloro-3-pyridyl)-(E)-3-(3-nitrophenyl)-2-propenamide obtained in (A) (0.69 g, 2.27 mmol) was suspended in pyridine (20 ml), and the suspension was added with phosphorous pentasulfide (0.51 g, 2.27 mmol), and then heated with stirring at about 100°C for 5 hours, and further heated under reflux for 30 minutes. After the reaction mixture was cooled, the mixture was added with saturated aqueous sodium hydrogencarbonate, and extracted with chloroform:methanol (10:1, v/v). The extract was washed with saturated brine, dried over anhydrous sodium sulfate, and then the solvent was evaporated. The residue was purified by silica gel column chromatography (chloroform, and hexane:ethyl acetate = 1:1 → 1:4, v/v → chloroform) to obtain the title compound as a pale orange solid (0.17 g, 26.4%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 7.46 (1H, dd, J=7.8, 4.4Hz), 7.50 (1H, d, J=15.6Hz), 7.62 (1H, t, J=7.8Hz), 7.65 (1H, d, J=15.6Hz), 7.91 (1H, d, J=7.8Hz), 8.21-8.40 (1H, m), 8.26 (1H, dd, J=8.3, 1.5Hz), 8.45-8.48 (1H, m), 8.59 (1H, dd, J=4.4, 1.5Hz)

(C) 3-[(E)-2-(Pyrido[3,2-d][1,3]thiazol-2-yl)-1-ethenyl]aniline

[0121] The 2-[(E)-2-(3-nitrophenyl)-1-ethenyl]pyrido[3,2-d][1,3]thiazole obtained in (B) (0.10 g, 0.35 mmol) was suspended in ethanol (15 ml), and the suspension was added with tin (II) chloride monohydrate (278 mg, 1.24 mmol), and heated under reflux for 3.5 hours. The reaction mixture was added with 1.5 N aqueous sodium hydroxide under ice cooling, and the mixture was extracted with chloroform. The organic layer was washed with saturated brine, and dried over anhydrous sodium sulfate. Then, the solvent was evaporated to obtain the title compound as a yellow solid (92 mg, quantitative).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 3.80 (2H, br), 6.72 (1H, dd, J=7.8, 2.4Hz), 6.91 (1H, m), 7.01 (1H, d, J=7.3Hz), 7.21 (1H, t, J=7.8Hz), 7.32 (1H, d, J=16.1Hz), 7.40 (1H, dd, J=8.3, 4.4Hz), 7.49 (1H, d, J=16.1Hz), 8.19 (1H, dd, J=8.3, 1.5Hz), 8.54 (1H, dd, J=4.4, 1.5Hz)

(D) 2-(2-Oxo-2-[3-[(E)-2-(pyrido[3,2-d][1,3]thiazol-2-yl)-1-ethenyl]anilino]ethyl)benzoic acid

[0122] The 3-[(E)-2-(pyrido[3,2-d][1,3]thiazol-2-yl)-1-ethenyl]aniline obtained in (C) (90 mg, 0.36 mmol) was dissolved in toluene (2 ml), and the solution was added with homophthalic anhydride (about 75%, 86 mg, 0.53 mmol) and heated under reflux for 30 minutes. After the reaction mixture was cooled, the deposited solids were collected by filtration and washed with ether to obtain the title compound as pale orange powder (121 mg, 82.0%).

25 Example 9: 2-(2-3-[(6-Isopropyl-2-pyridyl)methoxy]anilino-2-oxoethyl)-benzoic acid

(A) 2-Isopropylpyridine-N-oxide

- [0127] 2-Isopropylpyridine (5 g) was dissolved in acetic acid (27 mL), and the solution was added dropwise with peracetic acid (9.2 mL, 37% solution) and stirred at 70°C for 16 hours. The solvent was carefully evaporated under reduced pressure, and the residue was added with toluene and the remaining acetic acid was removed by azeotropy under reduced pressure. The residue was purified by distillation to obtain the title compound (4.9 g) from the fraction at 127°C/1 mmHg.  
<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.40 (6H, d, J=6.9 Hz), 3.91 (1H, heptuplet, J=6.9 Hz), 7.28 (1H, m), 7.38-7.47 (2H, m), 8.50 (1H, d, J=6.3 Hz)

(B) 6-Isopropyl-2-cyanopyridine

- [0128] The 2-isopropylpyridine-N-oxide obtained in (A) (4.9 g) was dissolved in dimethylformamide (25 mL), and the solution was added with sodium cyanide (5.26 g) and triethylamine (20 mL). The solution was added dropwise with chlorotrimethylsilane (13.6 mL) and then stirred at 120°C for 16 hours. After the reaction mixture was cooled, the solvent was evaporated under reduced pressure. The residue was distributed in ethyl acetate and 7% aqueous lithium chloride. The organic layer was washed with saturated brine, and dried over sodium sulfate. Then, the solvent was evaporated under reduced pressure, and the residue was purified by silica gel chromatography (hexane:ethyl acetate, 85:15, v/v) to obtain the title compound as oil (978 mg).  
<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.42 (6H, d, J=7.2 Hz), 3.22 (1H, heptuplet, J=7.2 Hz), 7.50 (1H, dd, J=7.9, 1.2 Hz), 7.62 (1H, dd, J=7.6, 1.0 Hz), 7.83 (1H, t, J=8.1 Hz)

(C) 6-Isopropylpicolinic acid

- [0129] The 6-isopropyl-2-cyanopyridine obtained in (B) (978 mg) was added with 5 N hydrochloric acid (13.5 mL), and the mixture was stirred at 110°C for 16 hours. The reaction mixture was cooled, and then adjusted to pH 5.5 with 1 N sodium hydroxide. The deposited solids were collected by filtration, and dried to obtain the title compound (534 mg). The mother liquid was adjusted to pH 5.5 with 1 N hydrochloric acid, and then extracted five times with methylene chloride. The organic layer was washed with saturated brine and dried over sodium sulfate, and then the solvent was evaporated under reduced pressure to further obtain 324 mg of the title compound.  
<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.41 (6H, d, J=6.9 Hz), 3.23 (1H, heptuplet, J=6.9 Hz), 7.55 (1H, d, J=8.1 Hz), 7.96 (1H, t, J=7.8 Hz), 8.14 (1H, d, J=7.5 Hz)

## (D) 6-Isopropyl-2-hydroxymethylpyridine

[0130] The 6-isopropylpicolinic acid obtained in (C) (200 mg) was dissolved in tetrahydrofuran (6 mL), and the solution was added dropwise with borane-tetrahydrofuran complex (1 M, 6 mL) at 0°C under nitrogen atmosphere. The reaction mixture was stirred at the same temperature for 3.5 hours, and added with methanol, and then the solvent was evaporated under reduced pressure. The residue was added with 1 N hydrochloric acid, and stirred for 20 minutes. The reaction mixture was adjusted to pH 11 with 5 N sodium hydroxide, and extracted four times with methylene chloride. The organic layer was dried over sodium sulfate, and the solvent was evaporated under reduced pressure. The residue was purified by silica gel chromatography (methylene chloride:methanol, 99:1, v/v) to obtain the title compound as colorless oil (145 mg).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.41 (d, J=6.9, 6H), 3.18 (heptuplet, J=6.9, 1H), 4.84 (s, 2H), 7.12 (d, J=7.8, 1H), 7.18 (d, J=7.5, 1H), 7.71 (d, J=7.8, 1H)

## (E) 3-Nitro-1-[(6-isopropyl-2-pyridyl)methoxy]benzene

[0131] The 6-isopropyl-2-hydroxymethylpyridine obtained in (D) (118 mg), triphenylphosphine (248 mg) and 3-nitrophenol (132 mg) were dissolved in anhydrous tetrahydrofuran (7 mL), and the solution was added with diethyl azodicarboxylate (150 μL) at 0°C under nitrogen atmosphere, and stirred at room temperature for 16 hours. The solvent was evaporated under reduced pressure, and the residue was distributed between ethyl acetate and 1 N sodium hydroxide. The organic layer was washed with saturated brine, and dried over sodium sulfate. The solvent was evaporated under reduced pressure, and the residue was purified by silica gel chromatography (hexane:ethyl acetate, 1:1, v/v) to obtain the title compound as yellow oil (202 mg).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.43 (6H, d, J=6.9Hz), 3.19 (1H, heptuplet, J=6.9Hz), 5.37 (1H, s), 7.24 (1H, d, J=7.5Hz), 7.42 (1H, d, J=7.8Hz), 7.44 (1H, ddd, J=8.4, 2.7, 1.2Hz), 7.54 (1H, t, J=8.4), 7.76 (1H, t, J=7.5Hz), 7.94 (1H, ddd, J=8.1, 2.4, 1.2Hz), 8.00 (1H, t, J=2.4Hz)

## (F) 2-[2-Oxo-2-(3-(E)-2-[4-(4-pyridyl)-1,3-thiazol-2-yl]-1-ethylanilino)ethyl]benzoic acid

[0132] The 3-nitro-1-[(6-isopropyl-2-pyridyl)methoxy]benzene obtained in (E) was treated in the same manner as in Example 3 (B) to obtain the title compound.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.43 (6H, d, J=6.9Hz), 3.32 (1H, heptuplet, J=6.9Hz), 4.08 (1H, s), 5.32 (1H, s), 6.34 (1H, broad s), 7.15 (2H, m), 7.29 (2H, m), 7.40-7.63 (3H, m), 7.57 (2H, m), 7.82 (1H, td, J=7.5, 2.4Hz), 8.11 (1H, d, J=8.1Hz)

## Example 10: 2-(2-Oxo-2-[3-[2-(4-phenyl-1,3-thiazol-2-yl)ethyl]anilino)ethyl]benzoic acid

## (A) Methyl (E)-3-(3-nitrophenyl)-2-propenate

[0133] 3-Nitrocinnamic acid (10.00 g, 51.8 mmol) was suspended in methanol (300 ml), and the suspension was added dropwise with concentrated sulfuric acid (10 ml), and heated under reflux for 6 hours while dehydration was carried out by means of a dropping funnel filled with molecular sieves. The solvent was evaporated, and the residue was added with water, and then extracted with ethyl acetate. The organic layer was washed with saturated aqueous sodium hydrogencarbonate and saturated brine, and dried over anhydrous sodium sulfate. The solvent was evaporated to obtain the title compound as a white solid (10.72 g, quantitative).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 3.84 (3H, s), 6.59 (1H, d, J=16.1Hz), 7.59 (1H, t, J=7.8Hz), 7.73 (1H, d, J=16.1Hz), 7.83 (1H, d, J=7.8Hz), 8.24 (1H, td, J=7.3, 1.5 Hz), 8.38 (1H, t, J=1.5Hz)

## (B) Methyl 3-(3-aminophenyl)propanate

[0134] The methyl (E)-3-(3-nitrophenyl)-2-propenate obtained in (A) (2.01 g, 9.70 mmol) was dissolved in methanol:ethyl acetate (1:1, v/v, 500 ml), and the solution was added with 10% palladium/carbon (0.2 g) and stirred at room temperature for 24 hours under hydrogen flow (1 atm.). The catalyst was removed by filtration, and the solvent was evaporated to obtain the title compound as pale orange oil (1.73 g, quantitative yield).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 2.59 (2H, t, J=7.8Hz), 2.84 (2H, t, J=7.8Hz), 3.66 (3H, s), 3.66 (2H, br), 6.47-6.53 (2H, m), 6.58 (1H, d, J=7.3Hz), 7.06 (1H, td, J=7.8, 2.9Hz)

## (C) Methyl 3-{3-[(N-tert-butoxycarbonyl)amino]phenyl}propanoate

[0135] The methyl 3-(3-aminophenyl)propanoate (1.73 g, 9.65 mmol) obtained in (B) was dissolved in chloroform (80 ml). The solution was added with di-tert-butyl dicarbonate (3.16 g, 14.5 mmol), added dropwise with triethylamine (336  $\mu$ l, 2.41 mmol), and then stirred at room temperature for 21 hours. Since remaining starting material was observed by TLC, the reaction mixture was further added with di-tert-butyl dicarbonate (3.16 g, 14.5 mmol) and triethylamine (336  $\mu$ l, 2.41 mmol), and stirred at room temperature for 5 hours. Still remaining starting material was observed by TLC, the reaction mixture was further added with di-tert-butyl dicarbonate (3.16 g, 14.5 mmol), and stirred at room temperature for 17 hours. After the solvent was evaporated, the residue was purified by silica gel column chromatography (hexane: ethyl acetate = 2:1, v/v  $\rightarrow$  chloroform) to obtain the title compound as colorless oil (2.34 g, 86.8%).  
 $^1\text{H-NMR}$  ( $\text{CDCl}_3$ )  $\delta$ : 1.52 (9H, s), 2.62 (2H, t,  $J=7.8\text{Hz}$ ), 2.92 (2H, t,  $J=7.8\text{Hz}$ ), 3.67 (3H, s), 6.46 (1H, br), 6.87 (1H, d,  $J=7.3\text{Hz}$ ), 7.13-7.25 (2H, m), 7.26 (1H, br)

## (D) tert-Butyl N-[3-(3-amino-3-oxopropyl)phenyl]carbamate

[0136] The methyl 3-{3-[(N-tert-butoxycarbonyl)amino]phenyl}propanoate obtained in (C) (1.84 g, 6.59 mmol) was dissolved in methanol (10 ml), and the solution was added dropwise with an ammonia solution in methanol (30 ml), and stirred at room temperature for 18 hours. Since a large amount of remaining starting material was observed by TLC, the reaction mixture was further added with an ammonia solution in methanol (100 ml), and stirred at room temperature for 6 hours. Since still remaining starting material was observed by TLC, the reaction mixture was further added with concentrated aqueous ammonia (28%, 50 ml), and further stirred at room temperature for 17 hours. After the methanol was evaporated, the residue was extracted with ethyl acetate, washed with saturated brine, and then dried over anhydrous sodium sulfate. The solvent was evaporated to obtain the title compound as colorless oil (1.60 g, 91.9%).

## (F) 3-[2-(4-Phenyl-1,3-thiazol-2-yl)ethyl]aniline

[0138] The tert-butyl N-[3-(3-amino-3-thioxopropyl)phenyl]carbamate obtained in (E) (200 mg, 0.72 mmol) was dissolved in ethanol (5 ml), and the solution was added with phenacyl bromide (142 mg, 0.72 mmol) and heated under reflux for one hour and 20 minutes. After the solvent was evaporated, the residue was added with saturated aqueous sodium hydrogencarbonate, and the mixture was extracted with chloroform and washed with saturated brine. The organic layer was dried over anhydrous sodium sulfate, and the solvent was evaporated. The residue was dissolved in methylene chloride (5 ml), and the solution was added dropwise with trifluoroacetic acid (5 ml) under ice cooling, and stirred for 30 minutes at the same temperature. After the solvent was evaporated, the residue was added with saturated aqueous sodium hydrogencarbonate, and then extracted with chloroform. The organic layer was washed with saturated brine, and dried over anhydrous sodium sulfate, and then the solvent was evaporated. The residue was purified by silica gel column chromatography (chloroform) to obtain the title compound as yellow oil (194 mg, 96.9%).

Example 11: 2-(2-Oxo-2-[3-[2-(4-phenyl-1,3-thiazol-2-yl)cyclopropyl]anilino)ethyl)-benzoic acid

(A) Methyl 2-(3-nitrophenyl)-1-cyclopropanecarboxylate

[0140] Ether (30 ml) and 40% aqueous potassium hydroxide (10 ml) were vigorously stirred under ice cooling, and the mixture was added portionwise with N-methyl-N'-nitro-N-nitrosoguanidine (3.55 g, 24.1 mmol), and stirred for 30 minutes at the same temperature. The reaction mixture was allowed to stand to prepare a diazomethane/ether solution as an upper layer.

[0141] Separately, the methyl (E)-3-(3-nitrophenyl)-2-propenate (500 mg, 2.41 mmol) synthesized in Example 10 (A) was dissolved in ether (300 ml), and the solution was added with palladium acetate (5 mg, 0.024 mmol) and atmosphere in the reaction system was replaced with nitrogen gas. The reaction mixture was slowly added with the diazomethane/ether solution prepared above under ice cooling, and the mixture was stirred at the same temperature for one hour and further at room temperature for one hour. The reaction mixture was added with acetic acid, and the solvent was evaporated. The residue was subjected to azeotropy by using toluene, and the residue was purified by silica gel column chromatography (hexane:ethyl acetate = 4:1, v/v) to obtain the title compound as light yellow oil (504 mg, 94.4%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.34-1.42 (1H, m), 1.64-1.73 (1H, m), 1.93-2.01 (1H, m), 1.58-1.66 (1H, m), 3.74 (3H, s), 7.46 (2H, d, J=5.4Hz), 7.94 (1H, s), 8.03-8.10 (1H, m)

(B) 2-(3-Nitrophenyl)-1-cyclopropanecarboxylic acid

[0142] The methyl 2-(3-nitrophenyl)-1-cyclopropanecarboxylate obtained in (A) (497 mg, 2.25 mmol) was dissolved in methanol (5 ml), and the solution was added dropwise with 1 N aqueous sodium hydroxide (5 ml, 5.0 mmol) and stirred at room temperature for one hour. The solvent was evaporated, and the residue was adjusted to approximately pH 1 by addition of 1 N aqueous hydrochloric acid, and then the mixture was extracted with ethyl acetate. The organic layer was washed with saturated brine, and dried over anhydrous sodium sulfate. The solvent was evaporated to obtain the title compound as white solid (471 mg, quantitative).

(C) 2-(3-Nitrophenyl)-1-cyclopropanecarboxamide

[0143] The 2-(3-nitrophenyl)-1-cyclopropanecarboxylic acid obtained in (B) (460 mg, 2.22 mmol) was added with thionyl chloride (10 ml), and the mixture was heated under reflux for 30 minutes. After the reaction mixture was cooled, excessive reagents were evaporated and the residue was subjected to azeotropy by using toluene. The residue was added with concentrated aqueous ammonia (28%, 20 ml) under ice cooling, and stirred at the same temperature for 2 hours and further at room temperature for 14 hours. The deposited solids were collected by filtration, washed with water, and dried to obtain the title compound as light yellow powder (398 mg, 87.1%).

## (F) 3-[2-(4-Phenyl-1,3-thiazol-2-yl)cyclopropyl]aniline

[0146] The 2-[2-(3-nitrophenyl)cyclopropyl]-4-phenyl-1,3-thiazole obtained in (E) (151 mg, 0.47 mmol) was dissolved in ethanol (10 ml), and the solution was added with tin (II) chloride monohydrate (372 mg, 1.65 mmol) and heated under reflux for 5 hours. The reaction mixture was added with 1.5 N aqueous sodium hydroxide under ice cooling, and then extracted with chloroform. The organic layer was washed with saturated brine, and dried over anhydrous sodium sulfate. The solvent was evaporated to obtain the title compound as pale orange oil (114 mg, 83.1%).

## (G) 2-(2-Oxo-2-(3-[2-(4-phenyl-1,3-thiazol-2-yl)cyclopropyl]anilino)ethyl)benzoic acid

[0147] The 3-[2-(4-phenyl-1,3-thiazol-2-yl)cyclopropyl]aniline obtained in (F) (114 mg, 0.39 mmol) was dissolved in toluene (3 ml), and the solution was added with homophthalic anhydride (about 75%, 95 mg, 0.59 mmol) and heated under reflux for 30 minutes. After the reaction mixture was cooled, the insoluble solids were collected by filtration, and washed with ether to obtain the title compound as white powder (139 mg, 78.4%).

(H) (4S,5S)-5-(3-[(4-isopropyl-5-methyl-1,3-thiazol-2-yl)methoxy]anilino)carbonyl)-2,2-dimethyl-1,3-dioxolane-4-carboxylic acid

[0222] The methyl (4S,5S)-5-(3-[(4-isopropyl-5-methyl-1,3-thiazol-2-yl)methoxy]anilino)carbonyl)-2,2-dimethyl-1,3-dioxolane-4-carboxylate obtained in (G) (139 mg, 0.31 mmol) was dissolved in THF:methanol (3:1, v/v, 4 ml), and the solution was added dropwise with a solution of lithium oxide monohydrate (14 mg, 0.34 mmol) in water (1 ml) under ice cooling, and then stirred at room temperature for 16 hours. After the solvent was evaporated, the residue was added with a small amount of water, and the mixture was washed with ether and adjusted to about pH 1 with 1 N aqueous hydrochloric acid. The mixture was extracted with ethyl acetate, and the organic layer was washed with saturated brine and dried over anhydrous sodium sulfate, and then the solvent was evaporated. The residue was added with hexane, and collected by filtration as powder. The powder was washed with hexane to obtain the title compound as light orange powder (98 mg, 73.0%).

(A) Methyl (1S\*,2R\*)-2-chlorocarbonylcyclopropane-1-carboxylate

[0226] A solution of (1R\*,2S\*)-2-(methoxycarbonyl)cyclopropane-1-carboxylic acid (215 mg, 1.49 mmol) in methylene chloride (5 mL) was added with DMF (one drop) and oxalyl chloride (143 mL, 1.64 mmol) at 0°C, and the mixture was stirred at 0°C for 2 hours. The reaction mixture was concentrated under reduced pressure by azeotropy using chloroform to obtain the title compound not purified as colorless oil (241 mg).

(B) Methyl (1S\*,2R\*)-2-(3-((E)-2-(4-isopropyl-1,3-thiazol-2-yl)-1-ethenyl)anilinocarbonyl)cyclopropane-1-carboxylate

[0227] A solution of 3-((E)-2-(4-isopropyl-1,3-thiazol-2-yl)-1-ethenyl)aniline (182 mg, 744 μmol) in methylene chloride (2 mL) was added with triethylamine (208 mL, 49 mmol) and a solution of the methyl (1S\*,2R\*)-2-chlorocarbonylcyclopropane-1-carboxylate (128 mg) obtained in (A) in methylene chloride (2 mL) at 0°C. The mixture was stirred at room temperature for 18 hours, and then added with 1 N aqueous hydrochloric acid and extracted with ethyl acetate. The organic layer was washed with saturated aqueous sodium hydrogencarbonate and saturated brine, dried over magnesium sulfate, and then concentrated under reduced pressure. The residue was purified by silica gel column chromatography (hexane:ethyl acetate, 1:1, v/v) to obtain the title compound as light yellow oil (180 mg, 65%).

(B) 2-[3-(tert-Butoxycarbonyl)-2-pyridyl]acetic acid

55 [0233] The tert-butyl 2-(2-ethoxy-2-oxoethyl)nicotinate obtained in (A) (736 mg, 2.77 mmol) was dissolved in a mixed solvent of THF, methanol and water (17 ml, 10:5:2, v/v), and the solution was added with lithium hydroxide monohydrate (128 mg) and stirred overnight at room temperature. The reaction mixture was neutralized with 10% aqueous citric acid, and then extracted with ethyl acetate. The organic layer was dried over magnesium sulfate, and then the solvent

was evaporated under reduced pressure to obtain the title compound as white crystals (516 mg, 78%).

(C) 2-[(4-Chloro-3-nitrophenoxy)methyl]-4-isopropyl-1,3-thiazole

**[0234]** 4-Chloro-3-nitrophenol (500 mg, 2.88 mmol) was dissolved in DMF, and the solution was added with potassium carbonate (796 mg) and 2-chloromethyl-4-isopropyl-1,3-thiazol (557 mg), and stirred overnight at room temperature. The reaction mixture was concentrated under reduced pressure, and the resulting residue was diluted with ethyl acetate, and washed with saturated brine. After the mixture was dried over magnesium sulfate, the solvent was evaporated under reduced pressure, and the residue was purified by silica gel chromatography (n-hexane:ethyl acetate, 12: 1, v/v) to obtain the title compound (767 mg, 85%).

(D) 2-Chloro-5-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]aniline

**[0235]** The 2-[(4-chloro-3-nitrophenoxy)methyl]-4-isopropyl-1,3-thiazole obtained in (C) (767 mg, 2.45 mmol) was dissolved in ethanol (15 ml), and the solution was added with stannous chloride (1628 mg) and heated under reflux overnight. The reaction mixture was left stand for cooling, and then added with 5 M aqueous sodium hydroxide (20 ml) and stirred for 15 minutes. The reaction mixture was extracted with ethyl acetate, and the organic layer was dried over magnesium sulfate. The solvent was evaporated under reduced pressure to obtain the title compound (647 mg, 93%).

(E) tert-Butyl 2-(2-(2-chloro-5-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]anilino)-2-oxoethyl)nicotinate

**[0236]** The 2-chloro-5-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]aniline obtained in (D) (110 mg, 388 mmol) and the 2-[3-(tert-butoxycarbonyl)-2-pyridyl]acetic acid obtained in (B) (101 mg, 0.426 mmol) were dissolved in methylene chloride (3 ml), and the mixture was added with diisopropylethylamine (0.101 ml) and N,N-bis(2-oxo-3-oxazolidinyl)phosphinic acid chloride (128 mg), and stirred overnight at room temperature. The reaction mixture was further added with diisopropylethylamine (0.253 ml) and N,N-bis(2-oxo-3-oxazolidinyl)phosphinic acid chloride (320 mg), and then stirred overnight. The reaction mixture was diluted with chloroform, and washed with saturated aqueous sodium hydrogencarbonate and saturated brine. After the reaction mixture was dried over magnesium sulfate, the solvent was evaporated under reduced pressure, and the residue was purified by silica gel chromatography (n-hexane:ethyl acetate, 5: 1, v/v) to obtain the title compound (71.5 mg, 37%).

(E) N1-3-[(E)-2-(4-isopropyl-1,3-thiazol-2-yl)-1-ethenyl]phenyl-2-(2-[(trifluoromethyl)sulfonyl]aminophenyl)acetamide

[0242] The 2-(2-[(trifluoromethyl)sulfonyl]aminophenyl)acetic acid obtained in (D) (515 mg, 1.82 mmol) was added dropwise with thionyl chloride (663 ml, 9.09 mmol) under ice cooling, and the mixture was stirred for 10 minutes at the same temperature, and further stirred for 30 minutes at room temperature. The solvent was evaporated, and the residue was dissolved in methylene chloride (20 ml). The solution was added dropwise with a solution of 3-[(E)-2-(4-isopropyl-1,3-thiazol-2-yl)-1-ethenyl]aniline (222 mg, 0.91 mmol) in methylene chloride (10 ml) and the triethylamine (1.27 ml, 9.09 mmol) under ice cooling, and added further with dimethylaminopyridine (222 mg, 1.82 mmol). The reaction mixture was stirred at the same temperature for 30 minutes and at room temperature for 20 hours, and then the solvent was evaporated. The residue was added with water, and extracted with chloroform. The organic layer was washed successively with 1 N aqueous hydrochloric acid, water, saturated aqueous sodium hydrogencarbonate, and then with saturated brine, and dried over anhydrous sodium sulfate, and then, the solvent was evaporated. The residue was purified by silica gel column chromatography (chloroform → chloroform:methanol = 50:1, v/v). The solvent was evaporated, and the residue was added with hexane and collected by filtration as powder. The powder was washed with hexane to obtain the title compound as pale orange powder (98 mg, 21.2%).

(C) tert-Butyl N-3-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]phenylcarbamate

[0300] A solution of the 4-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]aniline (149.0 mg) synthesized in (B) in a mixture of dioxane (4 ml) and THF (3 ml) was added with di-tert-butyl dicarbonate (261.9 mg) and saturated aqueous sodium hydrogencarbonate (4 ml) at room temperature, and the mixture was stirred for 3 hours. The reaction mixture was added with di-tert-butyl dicarbonate (65.5 mg) and stirred for 2 hours. The solvent was evaporated, and the resulting residue was added with ethyl acetate, and washed with water and saturated brine. The organic layer was dried over anhydrous sodium sulfate, and the solvent was evaporated. The resulting residue was purified by silica gel chromatography (hexane:ethyl acetate = 85:15, v/v) to obtain tert-butyl N-3-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]phenylcarbamate as colorless oil (126.5 mg, 60.5%).

(B) tert-Butyl N-ethyl-4-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]phenylcarbamate

[0301] A solution of tert-butyl N-3-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]phenylcarbamate (124.3 mg) in DMF (2 ml) was added with sodium hydride (21.4 mg) at room temperature, and the mixture was stirred for 30 minutes at the same temperature. The reaction mixture was then added with ethyl iodide (57.1 μl), and stirred at the same temperature for 1 hour. The reaction mixture was added with water and ethyl acetate, and washed with water and saturated brine. The organic layer was dried over anhydrous sodium sulfate, and the solvent was evaporated to obtain tert-butyl N-ethyl-4-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]phenylcarbamate as colorless oil (141.2 mg, quantitative).

(C) N-Ethyl-4-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]aniline

[0302] A solution of tert-butyl N-ethyl-4-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]phenylcarbamate (139.2 mg) in methanol (1 ml) was added with 4 N hydrochloric acid in dioxane (1 ml) at room temperature, and stirred at the same temperature for 1 hour. The solvent was evaporated, and the resulting residue was distributed between ethyl acetate and saturated aqueous sodium hydrogencarbonate. The aqueous layer was extracted with ethyl acetate, and the organic layer was washed with saturated brine, and dried over anhydrous sodium sulfate. The solvent was evaporated to obtain N-ethyl-4-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]aniline as colorless oil (85.8 mg, 87.0%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ : 1.24 (3H, t, J=7.1Hz), 1.29 (6H, d, J=6.8Hz), 3.05-3.15 (1H, m), 3.10 (2H, q, J=7.1Hz), 5.25 (2H, s), 6.56 (2H, d, J=8.8Hz), 6.87 (1H, s), 6.88 (2H, d, J=8.8Hz)

(D) Methyl 1-ethyl-6-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]-4-oxo-1,4-dihydro-2-quinolinecarboxylate

[0303] A solution of N-ethyl-4-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]aniline (84.3 mg) in methanol (2 ml) was added with dimethyl acetylenedicarboxylate (41.2 μl) at the room temperature, and the mixture was stirred at the same temperature for 2 hours. The solvent was evaporated to obtain a diester, which was then added with pyrophosphoric acid (2 ml) and heated at 110°C for 1 hour with stirring. The reaction mixture was cooled, added with water, and extracted with ethyl acetate. The organic layer was washed with water and saturated brine, and dried over anhydrous sodium sulfate. The solvent was evaporated, and the resulting residue was purified by silica gel chromatography (chloroform → chloroform:methanol = 98:2, v/v) to obtain methyl 1-ethyl-6-[(4-isopropyl-1,3-thiazol-2-yl)methoxy]-4-oxo-1,4-dihydro-

dro-2-quinolinecarboxylate as a light yellow solid (95.0 mg, 80.6%).

(A) Methyl 4-2-[(tert-butoxycarbonyl)amino]-4-pyridylbutanoate

[0317] tert-Butyl N-(4-methyl-2-pyridyl)carbamate (2.04 g, 9.80 mmol) was dissolved in THF (50 ml), and added dropwise with a 1.5 N solution of n-butyllithium in hexane (16.3 ml, 24.5 mmol) under nitrogen flow at -78°C over 5 minutes. The mixture was warmed to room temperature, stirred for 30 minutes, then cooled again to -78°C, added dropwise with methyl 3-bromopropionate (3.21 ml, 29.4 mmol), and stirred at the same temperature over 30 minutes.

The reaction mixture was added with water, warmed to room temperature, then extracted with ethyl acetate, washed with saturated brine, and then dried over anhydrous sodium sulfate. The solvent was evaporated, and the residue was purified by silica gel column chromatography (chloroform→chloroform: ethyl acetate) to obtain the title compound (1.10 g, 38.2%) as a mixture of a colorless oil and a solid.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.53 (9H, s), 1.93-2.05 (2H, m), 2.34 (2H, t, J=7.5Hz), 2.65 (2H, t, J=7.7Hz), 3.67 (3H, s), 6.79 (1H, dd, J=5.1, 1.2Hz), 7.81 (1H, brs), 8.11 (1H, brs), 8.15 (1H, d, J=5.1Hz)

(B) 4-2-[(tert-butoxycarbonyl)amino]-4-pyridylbutanoic acid

**[0318]** The methyl 4-2-[(tert-butoxycarbonyl)amino]-4-pyridylbutanoate obtained in (A) was treated in the same manner as in Example 11 (B) to obtain the title compound.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.54 (9H, s), 1.97-2.06 (2H, m), 2.39 (2H, t, J=7.1Hz), 2.70 (2H, t, J=7.6Hz), 6.82 (1H, dd, J=5.4, 1.5Hz), 7.87 (1H, brs), 8.00 (1H, d, J=5.4Hz), 8.32 (1H, brs)

(C) tert-Butyl N-[4-(4-amino-4-oxobutyl)-2-pyridyl]carbamate

**[0319]** The 4-2-[(tert-butoxycarbonyl)amino]-4-pyridylbutanoic acid obtained in (B) (0.38 g, 1.36 mmol) was dissolved in THF (20 ml), added dropwise with triethylamine (189.1 μl, 1.36 mmol), and with ethyl chloroformate (129.6 μl, 1.36 mmol) under ice cooling, and stirred at the same temperature for 15 minutes. A solution of concentrated aqueous ammonia (28%, 10 ml) in THF (10 ml) was added dropwise, and the mixture was stirred at the same temperature for 15 minutes. After the THF was evaporated, the residue was added with a small amount of water, extracted with chloroform, washed with saturated brine, and then dried over anhydrous sodium sulfate. The solvent was evaporated to obtain the title compound (0.46 g, quantitative yield) as a colorless solid.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.53 (9H, s), 1.97-2.07 (2H, m), 2.23 (2H, t, J=7.5Hz), 2.67 (2H, t, J=7.5Hz), 5.31-5.47 (1H, brs), 5.47-5.60 (1H, brs), 6.81 (1H, d, J=5.1Hz), 7.78 (1H, brs), 7.80 (1H, brs), 8.14 (1H, d, J=5.1Hz)

(D) tert-Butyl N-[4-(4-amino-4-thioxobutyl)-2-pyridyl]carbamate

**[0320]** The tert-butyl N-[4-(4-amino-4-oxobutyl)-2-pyridyl]carbamate obtained in (C) was treated in the same manner as in Example 11 (D) to obtain the title compound.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ: 1.52 (9H, s), 2.13-2.22 (2H, m), 2.62 (2H, t, J=7.3Hz), 2.69 (2H, t, J=7.3Hz), 6.82 (1H, d, J=5.1Hz), 6.25-7.47 (3H, m), 7.72 (1H, brs), 8.13 (1H, d, J=5.1Hz)

(E) tert-Butyl N-4-[3-(4-isopropyl-1,3-thiazol-2-yl)propyl]-2-pyridylcarbamate

**[0321]** The tert-butyl N-[4-(4-amino-4-thioxobutyl)-2-pyridyl]carbamate obtained in (D) (0.36 g, 1.22 mmol) was suspended in ethanol (10 ml) and added with 1-bromo-3-methyl-2-butanone (0.20 g, 1.22 mmol), and the mixture was heated under reflux for 1 hour. After the solvent was evaporated, the residue was added with saturated aqueous sodium hydrogencarbonate, extracted with chloroform, washed with saturated brine, and then dried over anhydrous sodium sulfate. The solvent was evaporated to obtain the title compound (0.40 g, 90.8%) as a pale yellow oil.

(A) Ethyl 2-(2-(tert-butoxycarbonyl)amino)-4-pyridyl acetate

[0325] tert-Butyl N-(4-methyl-2-pyridyl)carbamate (3.08 g, 14.8 mmol) was dissolved in THF (80 ml), and added dropwise with n-butyllithium (1.5 M solution in hexane, 20 ml) at -78°C under argon atmosphere, and then the reaction mixture was warmed to room temperature, and stirred at room temperature for 30 minutes. The mixture was cooled again to -78°C, added dropwise with a solution of ethyl chloroformate (1.42 ml) in THF (10 ml), and stirred at the same temperature for 1 hour. After a saturated aqueous ammonium chloride was added, the reaction mixture was distributed in ethyl acetate and saturated brine. The organic layer was dried over magnesium sulfate, the solvent was evaporated, and then the residue was purified by silica gel chromatography (chloroform) to obtain the title compound (2.6 g, 63%) as white powder.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ : 1.27 (3H, t, J=7.1Hz), 1.54 (9H, s), 3.61 (2H, s), 4.17 (2H, q, J=7.1Hz), 6.91 (1H, dd, J=5.1, 1.5Hz), 7.91 (1H, s), 8.22 (1H, d, J=5.1Hz), 8.49 (1H, brs)

(B) tert-Butyl N-(4-(2-amino-2-oxoethyl)-2-pyridyl)carbamate

[0326] The ethyl 2-(2-(tert-butoxycarbonyl)amino)-4-pyridylacetate obtained in (A) (550 mg, 1.96 mmol) was dissolved in THF (5 ml), added with 28% aqueous ammonia (10 ml), and stirred at room temperature for 6 days. The deposited solid was collected by filtration and dried to obtain the title compound (130 mg). The filtrate was extracted with chloroform, the extract was dried over magnesium sulfate, and then the solvent was evaporated to obtain 250 mg of the title compound (the total yield 350 mg, 71%).

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ : 1.53 (9H, s), 3.57 (2H, s), 6.94 (1H, dd, J=5.1, 1.5Hz), 7.61 (1H, s), 7.90 (1H, s), 8.21 (1H, d, J=5.1Hz)

(C) tert-Butyl N-[4-(2-amino-2-thioxoethyl)-2-pyridyl]carbamate

[0327] The tert-butyl N-(4-(2-amino-2-oxoethyl)-2-pyridyl)carbamate obtained in (B) was treated in the same manner as in Example 11 (D) to obtain the title compound.

<sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ : 1.54 (9H, s), 3.38-3.11 (2H, m), 3.99 (2H, s), 7.10 (1H, dd, J=5.1, 0.7Hz), 7.32 (1H, brs), 7.83 (1H, brs), 8.15 (1H, d, J=5.1Hz)

(D) (2-Amino-4-pyridyl)(4-isopropyl-1,3-thiazol-2-yl)methanone

[0328] The tert-butyl N-[4-(2-amino-2-thioxoethyl)-2-pyridyl]carbamate obtained in (C) (0.37 g, 1.38 mmol) was suspended in ethanol (10 ml), added with 1-bromo-3-methyl-2-butanone (0.23 g, 1.38 mmol), and heated under reflux for 1 hour. Since the material remained according to TLC, 1-bromo-3-methyl-2-butanone (0.23 g, 1.38 mmol) was further added, and the mixture was heated under reflux for another 1 hour. After the solvent was evaporated, the residue was added with saturated aqueous sodium hydrogencarbonate and extracted with chloroform, the extract was washed with saturated brine and then dried over anhydrous sodium sulfate, and the solvent was evaporated. The residue was purified by preparative TLC (chloroform:methanol = 30:1, v/v) to obtain tert-butyl N-4-[(4-isopropyl-1,3-thiazol-2-yl)carbonyl]-2-pyridylcarbamate (94.8 mg) as a pale orange oil and the title compound (71.9 mg, 21.0%) as a pale orange oil. The tert-butyl N-4-[(4-isopropyl-1,3-thiazol-2-yl)carbonyl]-2-pyridylcarbamate (94.8 mg) was dissolved in methylene chloride (2 ml), and added dropwise with trifluoroacetic acid (2 ml) under ice cooling, and the mixture was stirred at room temperature for 1 hour. After the solvent was evaporated, the residue was added with saturated aqueous sodium hydrogencarbonate, and extracted with chloroform, the extract was washed with saturated brine, dried over anhydrous

sodium sulfate, and the solvent was evaporated to obtain the title compound (68.8 mg). (The total yield, 140.7 mg, 41.1%).

(B) Dimethyl 2-[(3,4-difluorophenyl)-2-ethylhydrazono]malonate

**[0353]** The dimethyl 2-[(3,4-difluorophenyl)hydrazono]malonate obtained in (A) (7.18 g, 26.4 mmol) was dissolved in DMF (140 ml), added with 95% sodium hydride (800 mg, 31.7 mmol) under ice cooling under argon atmosphere, and stirred at room temperature for 1 hour. The mixture was cooled again with ice, added with ethyl iodide (4.24 ml, 52.8 mmol), stirred at room temperature for 1 hour, and then stirred at 75°C overnight. The mixture was left stand for cooling, then added with acetic acid (10 ml), and concentrated, and the resulting residue was diluted with chloroform, and washed with saturated brine. The organic layer was dried and concentrated, and the resulting residue was purified by silica gel column chromatography (hexane-ethyl acetate, 20:1, v/v) to obtain the title compound (4.86 g, 61%).

(D) Methyl 1-ethyl-6-fluoro-7-[(4-isopropyl-1,3-thiazol-2-yl)methyl]-4-oxo-1,4-dihydro-3-cinnolinecarboxylate

[0355] (4-Isopropyl-1,3-thiazol-2-yl)methanol (182 mg, 0.60 mmol) was dissolved in DMF (3 ml), added with 18-crown-6 (337 mg, 1.28 mmol), and sodium hydride (95%, 32.2 mg, 1.28 mmol), and stirred under argon atmosphere for 15 minutes. The mixture was added with the methyl 1-ethyl-6,7-difluoro-4-oxo-1,4-dihydro-3-cinnolinecarboxylate obtained in (C) (311 mg, 1.16 mmol), and stirred at room temperature for 1 hour. Then the reaction mixture was added with aqueous ammonium chloride, and extracted with ethyl acetate. The organic layer was dried over magnesium sulfate, and the solvent was evaporated under reduced pressure. The resulting residue was purified by preparative TLC (chloroform-ethyl acetate, 4:1, v/v) to obtain the title compound (380 mg, 81%) as yellow crystals.

(A) N<sup>3</sup>-(2-Cyanoethyl)-1-ethyl-6-fluoro-7-[(4-isopropyl-1,3-thiazol-2-yl)methyl]-4-oxo-1,4-dihydro-3-cinnolinecarboxamide

[0357] The 1-ethyl-6-fluoro-7-[(4-isopropyl-1,3-thiazol-2-yl)methyl]-4-oxo-1,4-dihydro-3-cinnolinecarboxylic acid obtained in Example 71 (E) (322 mg, 0.823 mmol) was dissolved in DMF (6 ml), added with ethyl chloroformate (0.117 ml, 1.23 mmol) and triethylamine (0.172 ml, 1.23 mmol) under ice cooling, and stirred for 1 hour. The mixture was warmed to room temperature, and further stirred for 30 minutes. The mixture was cooled again with ice, stirred for 1 hour, then added with cyanoethylamine (0.273 ml, 3.70 mmol), and stirred at room temperature for 3 days. The reaction mixture was diluted with ethyl acetate, washed with aqueous citric acid, saturated aqueous sodium hydrogencarbonate and water, and dried. The solvent was evaporated and the resulting residue was purified by silica gel column chromatography (chloroform-methanol, 200:1, v/v) to obtain the title compound (276 mg, 76%) as yellow crystals.

Test Example 1: Effect of combinational use with an antimicrobial agent on multidrug resistant *Pseudomonas aeruginosa*

[0360] As multidrug resistant *Pseudomonas aeruginosa*, *Pseudomonas aeruginosa* PAM 1723 strain highly expressing the drug efflux pump was used. As antimicrobial drugs for the combinational uses, levofloxacin (LVFX) as a quinolone antibacterial agent and aztreonam (AZT) as a monobactam antibiotic were used.

[0361] Each of the compounds shown in Table 1 with Example No., which falls within the compounds of the present invention, was subjected to the measurement of its minimum concentration ( $\mu$ g/ml) that was required to enhance the antibacterial activity of the antibacterial agent when the test compound was used in combination with the antibacterial drug applied at a concentration of 1/4, or 1/8 or less of the minimum inhibitory concentration against the PAM 1723 strain. Each value in Table 1 shows a minimum concentration ( $\mu$ g/ml) of each compound that was required to enhance the antibacterial activity when the test compound was used in combination with the antibacterial drug applied at a concentration of 1/8 or less of the minimum inhibitory concentration. As for levofloxacin, effects were indicated as combinational uses for 7.5 hours, and as for aztreonam, effects as combinational uses for 18 hours was indicated. The Müller-Hinton broth (MHB, Difco) was used as a medium, and the inoculated amount of the bacteria was  $1 \times 10^6$  CFU/ml. Effects were determined by optically measuring the transmittance of the bacterial culture with time, and visually observing the turbidity of the medium. As clearly shown in Table 1, the compounds of the present invention exhibited effect on the drug resistant *Pseudomonas aeruginosa* in the combinational uses mainly by inhibiting acquisition of resistance due to the drug efflux pump, and accordingly, it can be concluded that the class of compounds are expected to be useful clinically.

## Example 73

## (1) Calculation of pharmacophore

[0362] By using the conformation search function of CATALYST™, calculation was performed on the compounds of Examples 1, 10, 15, 27, 37, 49 and 70 shown in Table 1 in the best quality at the energy tolerance of the conformation generated of 20 kcal/mol and the maximum number of conformations of 250. Then, all the conformations generated were input in the compound information. Pharmacophores were calculated using all of the above compounds by means of CATALYST/HipHop, one of the functions of pharmacophore generation (Hypothesis) by CATALYST™. Among the results obtained, one pharmacophore having the highest adequacy was selected.

[0363] The resulting pharmacophore is shown in Fig. 1. Each site in the figure is shown as a sphere having the radius of 1.7 Å from its center. Each tolerance of Site 1 and Site 4 is indicated as a sphere having the radius (tolerance) of 2 Å from each center. The result obtained by overlaying all the compounds on the resulting pharmacophore is shown in Fig. 2. For overlaying the compounds, the Compare/Fit function of CATALYST™ was used. In Fig. 2, hydrogen atoms are not shown. In the figure, each site is indicated as the scope of the spherical part, and Site 1 and Site 4 are shown as spheres having the radius of 1.7 Å (The actual tolerance is a sphere having the radius of 2 Å.). Figs. 3 to 9 show the mode of overlay of each compound on the pharmacophore. Fig. 3 shows the result obtained by the compound of Example 1, Fig. 4 for the compound of Example 10, Fig. 5 for the compound of Example 15, Fig. 6 for the compound of Example 27, Fig. 7 for the compound of Example 37, Fig. 8 for the compound of Example 49, and Fig. 9 for the compound of Example 70.

## (2) Evaluation whether or not a compound fits the pharmacophore

[0364] Evaluation whether or not a compound fits the pharmacophore can be performed as follows. The conformation of the compound is calculated using a program based on the molecular force field method such as, for example, CATALYST™, CHARMM, and MMFF, or a program based on the molecular orbital method such as MOPAC (these

programs are given as examples and programs are not limited to these mentioned above). Each conformation is individually overlaid on the pharmacophore by using a program such as CATALYST™ or manually. A compound whose partial structures occupy the aforementioned four sites, or a compound whose partial structures are in contact with the four sites can be considered to fit the pharmacophore and determined to have an inhibitory activity against the drug efflux pump of *Pseudomonas aeruginosa*. More specifically, when the compound is overlaid on the pharmacophore, and for each of the sites, when constitutional atoms in the partial structure that conform with the feature of the site is located within 0.5 to 3 Å from the site, more preferably, when the atoms are within the tolerance of 2 Å for Site 1 and Site 4 and within the tolerance of 1.7 Å for Site 2 and Site 3, the compound is determined to fit the pharmacophore.

[0365] For example, as shown in Figs. 3 to 7 and Fig. 9, the partial structure of each compound occupies the inside of the sphere generated from the center of each site with the radius of 1.7 Å, and satisfies the aforementioned tolerance. The compound shown in Fig. 8 has the partial structures for Site 2 and Site 3 which are within the spheres generated from the center of each site with the radius of 1.7 Å. As for Site 1 and Site 4, the partial structures are in contact with the spheres similarly generated from the center of each site with the radius of 1.7 Å and are within 2 Å. Therefore, the compound is determined to satisfy the aforementioned tolerance.

#### Industrial Applicability

[0366] The medicament of the present invention has an inhibitory activity against the drug efflux pumps of microorganisms, and the medicament has preventing action on the acquisition of resistance to an antimicrobial drug by a microorganism, as well as resistant-eliminating action on a microorganism with acquired resistance. Therefore, the medicament of the present invention can achieve excellent effect in preventive and/or therapeutic treatment of a microbial infection when used, for example, in combination with the administration of an antimicrobial drug.

#### Claims

1. A method for preventive and/or therapeutic treatment of a microbial infection, which comprises the step of administering to an mammal including a human a preventively and/or therapeutically effective amount of a compound represented by the following general formula (I), a physiologically acceptable salt thereof, or a hydrate thereof, wherein:

R<sup>1</sup> and R<sup>2</sup> independently represent hydrogen atom, a halogen atom, carboxyl group, an alkoxycarbonyl group, an amino group which may be substituted, an alkyl group which may be substituted, an aryl group which may be substituted, or a heterocyclic group which may be substituted, or R<sup>1</sup> and R<sup>2</sup> represent a saturated or unsaturated 5- to 7-membered ring formed by binding to each other together with two adjacent ring-membered atoms of J<sup>1</sup> to which R<sup>1</sup> and R<sup>2</sup> bind;

R<sup>3</sup> represents hydrogen atom, hydroxyl group, or an alkoxy group;

J<sup>1</sup> represents a 5- or 6-membered heteroaromatic ring;

W<sup>1</sup> represents a group selected from the group consisting of -CH=CH-, -C≡C-, -CH<sub>2</sub>CH<sub>2</sub>-, -OCH<sub>2</sub>-, -SCH<sub>2</sub>-, -OCH<sub>2</sub>O-, -CH<sub>2</sub>O-, -CH<sub>2</sub>-, -CO-, -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>-, -CH<sub>2</sub>NH-, -NHCH<sub>2</sub>-, -CH<sub>2</sub>S-, -CONH-, -CH<sub>2</sub>SCH<sub>2</sub>-, -CH=CH-CONH- and -CH<sub>2</sub>OCH<sub>2</sub>- (each group binds at its left end to a ring-membered atom of J<sup>1</sup>) or single bond;

A<sup>1</sup> represents a phenylene group which may be substituted, a pyridinediyl group which may be substituted, a furandiyl group which may be substituted, a thiophenediyl group which may be substituted, a benzofurandiyl group which may be substituted, a benzo[b]thiophenediyl group which may be substituted, a benzoxazolediyl group which may be substituted, a benzothiazolediyl group which may be substituted, a pyrido[1,2-a]pyrimidinediyl group which may be substituted, a quinazolinediyl group which may be substituted, a benzotriazinediyl group which may be substituted, a 2H-chromenediyl group which may be substituted, a quinolin-4-one-diyl group which may be substituted, an azaquinolin-4-one-diyl group which may be substituted, a quinolinediyl group which may be substituted, a thiadiazolo[3,2-a]pyrimidinediyl group which may be substituted, or a thiazolo[3,2-a]pyrimidinediyl group which may be substituted;

G<sup>1</sup> represents oxygen atom, carbonyl group, ethynyl group, -CH=N-, -N(R<sup>4</sup>)-CO-, -(CH<sub>2</sub>)-N(R<sup>5</sup>)-CO-, -N(R<sup>6</sup>)-, -N(R<sup>7</sup>)-SO<sub>2</sub>-, -SO<sub>2</sub>-N(R<sup>8</sup>)-, -CON(R<sup>9</sup>)-, -C(=CHR<sup>10</sup>)-, -C(R<sup>11</sup>)=C(R<sup>12</sup>)-, -NHCO-C(R<sup>13</sup>)(R<sup>14</sup>)-, -CONH-C(R<sup>15</sup>)(R<sup>16</sup>)- or -CH<sub>2</sub>O(CH<sub>2</sub>)<sub>q</sub>- wherein R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup>, R<sup>7</sup>, R<sup>8</sup> and R<sup>9</sup> independently represent hydrogen atom, hydroxyl group or an alkyl group which may be substituted; R<sup>10</sup> represents cyano group, carboxyl group or an alkoxy-carbonyl group which may be substituted; R<sup>11</sup> and R<sup>12</sup> independently represents hydrogen atom, a halogen atom, an alkyl group which may be substituted, or an aryl group which may be substituted, or R<sup>11</sup> and R<sup>12</sup> represent a ring formed by binding to each other; R<sup>13</sup> and R<sup>14</sup> independently represent hydrogen atom or an alkyl group, or R<sup>13</sup> and R<sup>14</sup> represent an alkylene group formed by binding to each other; R<sup>15</sup> and R<sup>16</sup> independently represent hydrogen atom or an alkyl group, or R<sup>15</sup> and R<sup>16</sup> represent an alkylene group formed by binding to each other; and q represents an integer of from 0 to 5;

p represents an integer of from 0 to 3;

G<sup>2</sup> represents a phenylene group which may be substituted, a furandiyl group which may be substituted, a tetrahydrofurandiyl group which may be substituted, a pyridinediyl group which may be substituted, a thiazolinediyl group which may be substituted, an isoxazolidinediyl group which may be substituted, a 1,3-dioxolanediy group which may be substituted, a thiophenediyl group which may be substituted, a pyrimidinediyl group which may be substituted, -C(R<sup>17</sup>)=C(R<sup>18</sup>)-[C(R<sup>19</sup>)=C(R<sup>20</sup>)]<sub>y</sub>- wherein R<sup>17</sup>, R<sup>18</sup>, R<sup>19</sup> and R<sup>20</sup> independently represent hydrogen atom, a halogen atom, an alkyl group which may be substituted, or an aryl group which may be substituted, or represent a ring formed by R<sup>17</sup> and R<sup>18</sup> bound to each other, and/or a ring formed by R<sup>19</sup> and R<sup>20</sup> bound to each other, and y represents an integer of from 0 to 3, or -C(R<sup>21</sup>)(R<sup>22</sup>)-C(R<sup>23</sup>)(R<sup>24</sup>)- wherein R<sup>21</sup>, R<sup>22</sup>, R<sup>23</sup> and R<sup>24</sup> independently represent hydrogen atom, phenyl group, or an alkyl group having 1 to 6 carbon atoms, or represent a ring formed by R<sup>21</sup> and R<sup>22</sup> bound to each other and/or a ring formed by R<sup>23</sup> and R<sup>24</sup> bound to each other, or alternatively, represent a ring formed by R<sup>21</sup> and R<sup>23</sup> bound to each other;

G<sup>3</sup> represents -CH<sub>2</sub>- or single bond;

m and n independently represent an integer of 0 or 1; and

Q<sup>1</sup> represents an acidic group.

2. A method for eliminating resistance of a microorganism with acquired resistance to an antimicrobial agent, which comprises the step of contacting with the microorganism an effective amount of a compound represented by the general formula (I) according to claim 1, a physiologically acceptable salt thereof, or a hydrate thereof.
3. A method for inhibiting acquisition of resistance to an antimicrobial agent by a microorganism, which comprises the step of contacting with a microorganism an effective amount of a compound represented by the general formula (I) according to claim 1, a physiologically acceptable salt thereof, or a hydrate thereof.
4. A method for improving efficacy of an antimicrobial agent, which comprises the step of administering to a mammal including a human an effective amount of a compound represented by the general formula (I) according to claim 1, a physiologically acceptable salt thereof, or a hydrate thereof.
5. A method for enhancing sensitivity of a microorganism to an antimicrobial agent, which comprises the step of contacting with a microorganism an effective amount of a compound represented by the general formula (I) according to claim 1, a physiologically acceptable salt thereof, or a hydrate thereof.
6. The method according to any one of claims 1 to 5 wherein the microorganism is *Pseudomonas aeruginosa*.
7. A pharmaceutical composition for preventive and/or therapeutic treatment of a microbial infection, which comprises a compound represented by the general formula (I) according to claim 1, a physiologically acceptable salt thereof, or a hydrate thereof together with an antimicrobial agent.
8. A compound represented by the general formula (II), a salt thereof, or a hydrate thereof:

wherein R<sup>31</sup> and R<sup>32</sup> independently represent hydrogen atom, a halogen atom, carboxyl group, an alkoxy-car-

bonyl group, an amino group which may be substituted, an alkyl group which may be substituted, an aryl group which may be substituted, or a heterocyclic group which may be substituted, or  $R^{31}$  and  $R^{32}$  represent a 6-membered ring formed by  $R^{31}$  and  $R^{32}$  bound to each other together with two adjacent ring-membered atoms of  $J^{11}$ ;

$J^{11}$  represents a 5- or 6-membered heteroaromatic ring;

$W^{11}$  represents a group selected from the group consisting of  $-\text{CH}=\text{CH}-$ ,  $-\text{CH}_2\text{CH}_2-$ ,  $-\text{OCH}_2-$ ,  $-\text{SCH}_2-$ ,  $-\text{OCH}_2\text{O}-$ ,  $-\text{CH}_2\text{O}-$ ,  $-\text{CH}_2-$ ,  $-\text{CO}-$ ,  $-\text{CH}_2\text{CH}_2\text{CH}_2-$ ,  $-\text{CH}_2\text{NH}-$ ,  $-\text{NHCH}_2-$ ,  $-\text{CH}_2\text{S}-$ ,  $-\text{CONH}-$ ,  $-\text{CH}_2\text{SCH}_2-$ ,  $-\text{CH}=\text{CH}-\text{CONH}-$  and  $-\text{CH}_2\text{OCH}_2-$  (each group binds at its left end to a ring-membered atom of  $J^{11}$ ) or single bond;

$A^{11}$  represents a pyridinediyl group which may be substituted, a pyrido[1,2-a]pyrimidinediyl group which may be substituted, a quinolin-4-one-diyl group which may be substituted, an azaquinolin-4-one-diyl group which may be substituted, a quinolinediyl group which may be substituted, a thiazolo[3,2-a]pyrimidinediyl group which may be substituted;  $G^{11}$  represents oxygen atom, carbonyl group, ethynyl group,  $-\text{CH}=\text{N}-$ ,  $-\text{N}(\text{R}^{33})\text{CO}-$ ,  $-\text{N}(\text{R}^{34})-\text{SO}_2-$ ,  $-\text{SO}_2-\text{N}(\text{R}^{35})-$ ,  $-\text{CO}-\text{N}(\text{R}^{36})-$ ,  $-\text{C}(\text{CHR}^{37})-$  or  $-\text{C}(\text{R}^{38})=\text{C}(\text{R}^{39})$  wherein  $\text{R}^{33}$ ,  $\text{R}^{34}$ ,  $\text{R}^{35}$ ,  $\text{R}^{36}$ ,  $\text{R}^{37}$ ,  $\text{R}^{38}$  and  $\text{R}^{39}$  independently represent hydrogen atom or an alkyl group which may be substituted;

$m$  represents an integer of 0 or 1; and

$Q^{11}$  represents an acidic group.

9. A medicament comprising a compound represented by the general formula (II) according to claim 7, a physiologically acceptable salt thereof, or a hydrate thereof as an active ingredient.
10. The medicament according to claim 9 which is a medicament for preventive and/or therapeutic treatment of a microbial infection.
11. A compound, a salt thereof, or a hydrate thereof **characterized by** having a partial structure occupying the following four sites in the following tolerance, and having an inhibitory action against drug efflux pump of *Pseudomonas aeruginosa*.

Site	Feature	x (Å)	y (Å)	z (Å)	Tolerance (Å)
1	Hydrophobic	8.839	-0.324	1.49	2
2	Hydrophobic	4.819	1.836	-0.29	1.7
3	Hydrophobic	-1.722	-0.964	0.89	1.7
4	Negative Ionizable	-8.636	-1.067	-2.554	2

12. The compound according to claim 11, a salt thereof, or a hydrate thereof which has the inhibitory activity against the drug efflux pump of *Pseudomonas aeruginosa* of 40  $\mu\text{g/mL}$  or less.
13. The compound according to claim 11 or claim 12, a salt thereof; or a hydrate thereof which is represented by the general formula (I) according to claim 1.
14. The compound according to claim 11 or claim 12, a salt thereof, or a hydrate thereof which is represented by the general formula (II) according to claim 8.
15. A drug efflux pump inhibitor which comprises the compound according to any one of claims 11 to 14, a physiologically acceptable salt thereof, or a hydrate thereof.
16. A medicament for preventive and/or therapeutic treatment of a microbial infection which comprises as an active ingredient the compound according to any one of claims 11 to 14, a physiologically acceptable salt thereof, or a hydrate thereof.
17. A method for screening a compound having an inhibitory activity against drug efflux pump of *Pseudomonas aeruginosa* which comprises a step of determining whether or not a partial structure of a test compound occupies the four sites according to claim 11 in the tolerance according to claim 11 by means of a computer program and/or an experimental three dimensional structure analysis.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/JP00/07565

**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 1,4  
because they relate to subject matter not required to be searched by this Authority, namely:  
They pertain to methods for treatment of the human body by therapy.
2. ☒ Claims Nos.: 1-17  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  
(See extra sheet.)
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

(See extra sheet.)

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☒ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.

## INTERNATIONAL SEARCH REPORT

International application No.

PCT/JP00/07565

Continuation of Box Nos. I, II of continuation of first sheet (1)

The general formulae (I) and (II) of the compounds as described in claims 1 and 8 are variable in most of the structures thereof and thus there is no novel and important chemical structure common to compounds involved therein. Accordingly, it is impossible to comprehend any general single inventive concept on the basis of the description of these claims. It is stated that each substituent in the general formulae is not particularly specified in the substituent type. In addition, such a substituent may further have other substituents, which makes the scope thereof unclear. Furthermore, the substituents Q1 and Q11 are merely defined each as "an acidic group" in claims and thus the scope thereof is unclear. In the illustration of Q1 and Q11 in the description, moreover, alkoxy groups, etc., which are not regarded as acidic groups in general, are also included in the scope thereof. That is to say, the contents of the description are not well-organized.

As in claim 11, compounds which are defined merely by the site distance without using any chemical structure are substantially unclear.

In this international search report, therefore, prior art search has been practiced exclusively on the compounds of the general formulae (I) and (II) wherein:

W1 and W11 represent each  $-\text{CH}=\text{CH}-$ ,  $-\text{CH}_2\text{CH}_2-$ ,  $-\text{CH}_2\text{O}-$  or  $-\text{CH}_2\text{CH}_2\text{CH}_2-$ ;

G3 is a single bond;

m, n and p are 0; and

Q1 and Q11 represent each carboxy, fluoromethanesulfonylamido, N-cyanocarboxamido or 5-tetrazolyl.
